

Creating Tests From Oracle Enterprise or BEA AquaLogic Repositories

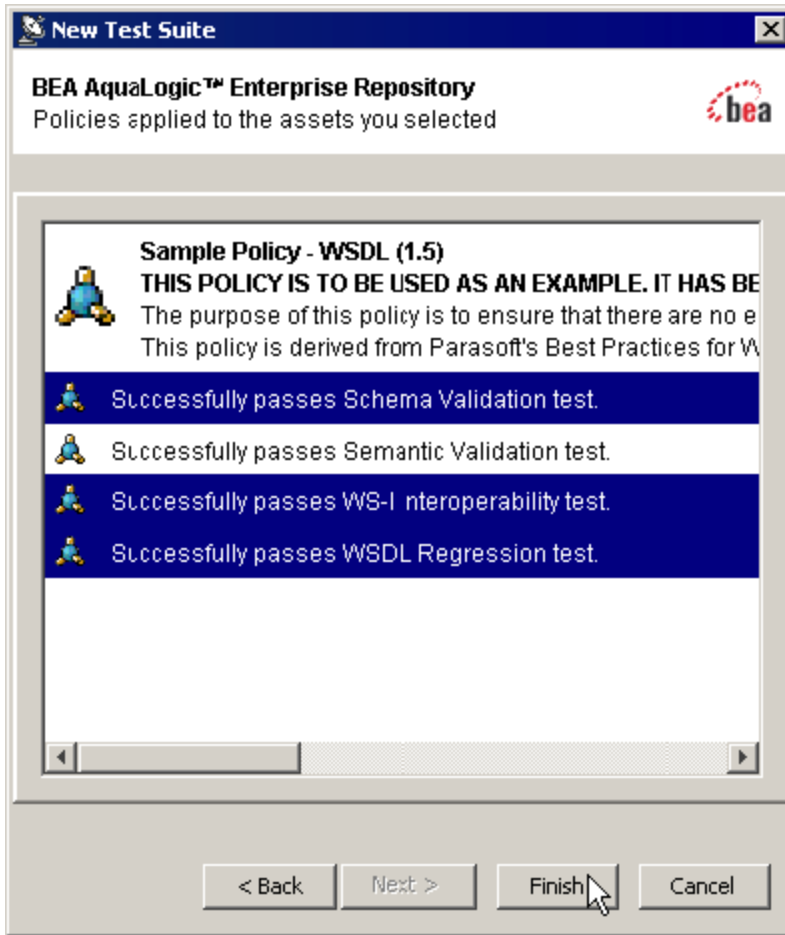

SOAtest can create tests that enforce policies applied to Web service assets declared in an Oracle/BEA repository. You can select a Web service asset and choose the desired policies to enforce.

To enforce Oracle/BEA AquaLogic policies, complete the following:

1. Choose the **Other > BEA AquaLogic Enterprise Repository** option in one of the available test creation wizards. For details on accessing the wizards, see:
 - [Adding a New .tst File to an Existing Project](#)
 - [Adding a New Test Suite](#)
2. In the BEA AquaLogic Enterprise Repository wizard page, enter the location of the repository in the **Repository URL** field, enter a **Username** and **Password**. To save these settings, click the **Save to Preferences** button.
3. Click the **Next** button. A list of **Available Web Service Assets** corresponding to the selected repository displays.

4. Select the desired Web service asset from the list and click the **Next** button. A list of **Policies applied to the assets you selected** displays.

5. Select the desired policies and click the **Finish** button. SOAtest creates a test suite with the selected policies and tests whether these policies are enforced against the Web service assets.
