

Deploying the SOAtest and Virtualize Server WAR File

The Parasoft SOAtest and Virtualize Server WAR file is a lightweight server that provides the following functionality:

- Hosting service virtualization assets created in Virtualize Desktop or via the thin-client interface of Continuous Testing Platform (CTP).
- Executing tests created in the SOAtest Desktop or Continuous Testing Platform.

The server architecture is designed to provide a smaller memory footprint for higher performance of individual servers, as well as to let organizations take advantage of standardized application deployment infrastructures for availability, clustering, and scalability. It is designed to be deployed within containers such as Docker.

This server is distributed as a Web application ARchive (WAR) and can be deployed to any certified servlet container. It does not currently support provisioning actions or health checks (for CTP). Workspace/project data sources and Eclipse variables in virtual asset files are deprecated in this server.
