

# SQL Responder

This topic explains how to configure the SQL Responder tool, which virtualizes database responses to various queries. Responders are the core tools used in Parasoft Virtualize.

Sections include:

- [Creating SQL Responders](#)
- [Modifying Queries and Results](#)
- [Using Criteria Expressions to Match Values](#)
- [Modifying Response Times](#)
- [Chaining Tools to the Responder's SQL Query or Result Set](#)

## Creating SQL Responders

For details on creating SQL Responders, see [Creating SQL Responders from a Database Recording](#) and [Creating SQL Responders Manually](#).

## Modifying Queries and Results

Each SQL Responder handles SQL queries for a particular JDBC URL. When a query is received, it is matched against the set of available query templates. If a match is found, the correlated result set is used as a response. You can customize the virtualized database behavior by modifying the queries that the SQL Responder handles and the results it delivers.

To modify the queries that the tool handles, add or edit SQL templates. Wildcards can be used.

To modify the results that are delivered, add or edit the associated parameters and result sets.

The manner in which you add and edit data depends on whether the SQL Responder was created to be parameterized from a CSV or from a Parasoft Data Repository.

## Editing Data Stored in a Data Repository

To edit data stored in a Data Repository, click the **Open in Table Editor** button in the SQL Responder editor.

This opens the associated data repository editor—where you can review and edit/extend the stored values. You can also open the data repository editor by double-clicking the appropriate **SQL Data Sets** node in the Data Repositories view.

### Initial View (Level 1)

The initial view of the data repository will always show three columns at the top level:

- **JDBC Connection URL (string):** The name of the database recording you selected in the wizard.
- **SQL Template (string):** The SQL queries recorded. When the SQL Responder receives a query, it tries to match it against the set of available query templates. If a match is found, the correlated result set is used as a response.
- **SQL Parameters (list of data set records):** The parameters recorded for the above SQL queries (values in WHERE clauses, etc).

▼ **Data Repository**

▶ [testImportOracle] ▶ [testImportOracle] ▶

JDBC URL	SQL Template	SQL Parameters
jdbc:oracle:thin:@(...	{'1' = call pr83185_func2(?);out=1	SQL Parameters{1} ...
jdbc:oracle:thin:@(...	ResultSetMetaData: select e.emplo...	SQL Parameters{5} ...
jdbc:oracle:thin:@(...	select e.employee_id, e.first_name, ...	SQL Parameters{5} ...
jdbc:oracle:thin:@(...	ResultSetMetaData: select e.emplo...	SQL Parameters{1} ...

JDBC Connection URL and SQL Template are key columns (as indicated by the light purple coloring). The yellow coloring in the SQL Parameters column indicates that you can drill down into it.

### SQL Parameters Table (Level 2)

Double-clicking a value in the **SQL Parameters** column opens the SQL Parameters table, which always contains the following columns:

- **Result Set:** Lets you drill down into result set values.
- **Additional Response Delay:** Lets you adjust timing as described in [Modifying Response Times](#).

If any parameters were associated with the recorded query (values in WHERE clauses, etc), additional columns will be added to allow you to view and edit related parameter values.

▼ **Data Repository**

▶ [testImportOracle] ▶ testImportOracle: 1 ▶ SQL Parameters: 0 ▶

ResultSetMetaData: select:select e.employee\_id, e.first\_name, e.last\_name, cursor(select d.email from EMPLOYEES d where d.employee\_id = e.employee\_id) email from EMPLOYEES e where salary < \${salary};row=\${row}&column=email

	row	salary	Result Set	Additional Response Delay...
SQL Parameters: 0	1	2500	Result Sets{20} ...	1000
SQL Parameters: 1	2	2500	Result Sets{20} ...	2000
SQL Parameters: 2	3	2500	Result Sets{20} ...	3000
SQL Parameters: 3	4	2500	Result Sets{20} ...	4000
SQL Parameters: 4	5	2500	Result Sets{20} ...	5000

### Result Set Table (Level 3)

From the SQL Parameters view, double-clicking a value in the Result Set column opens the **Result Set** table, which allows you to edit the values that will be used in a response.

EMAIL	EMPL...	FIRST_NAME	HIRE_DATE	LAST_NAME	PHONE_NUMB...	SALARY
SKING	100	Steven	1987-06-17 00:0...	King	515.123.4567	24000
NKOC...	101	Neena	1989-09-21 00:0...	Kochhar	515.123.4568	17000
LDEH...	102	Lex	1993-01-13 00:0...	De Haan	515.123.4569	17000
AHUN...	103	Alexander	1990-01-03 00:0...	Hunold	590.423.4567	9000
BERNST	104	Bruce	1991-05-21 00:0...	Ernst	590.423.4568	6000
DAUS...	105	David	1997-06-25 00:0...	Austin	590.423.4569	4800
VPAT...	106	Valli	1998-02-05 00:0...	Pataballa	590.423.4560	4800
DLORE...	107	Diana	1999-02-07 00:0...	Lorentz	590.423.5567	4200
NGREE...	108	Nancy	1994-08-17 00:0...	Greenberg	515.124.4569	12000

## Editing

To review, edit, and extend the SQL templates, result sets, and associated parameters, use the data repository editor functionality, which is described in [Viewing and Modifying the Repository Structure and Contents](#).

The screenshot shows the 'Data Repository' interface. At the top, there is a breadcrumb path: [testImportOracle] > testImportOracle 2 > SQL Parameters: 0. Below this, a text area contains the following SQL query:

```
select e.employee_id, e.first_name, e.last_name, cursor(select d.email from EMPLOYEES d where
d.employee_id = e.employee_id) email from EMPLOYEES e where salary < ${salary};row=${row}
&column=email
```

Below the query is a table displaying the results. The table has five columns: 'row', 'salary', 'Result Set', and 'Additional Response ...'. The data is as follows:

	row	salary	Result Set	Additional Response ...
SQL Parameters: 0	1	999999	Result Sets{1} ..	1000
SQL Parameters: 1	2	2500	Result Sets{1} ..	2000
SQL Parameters: 2	3	2500	Result Sets{1} ..	3000
SQL Parameters: 3	4	2500	Result Sets{1} ..	4000
SQL Parameters: 4	5	2500	Result Sets{1} ..	5000

	JDBC URL	SQL Template	SQL Parameters
2db: 0	jdbc:db2://devel198.parasoft.co...	select firstnme, lastname, sal...	SQL Parameters{1} ...
2db: 1	jdbc:db2://devel198.parasoft.co...	2	SQL Parameters{0} ...
2db: 2	jdbc:db2://devel198.parasoft.co...	[*]	SQL Parameters{0} ...

If you prefer to edit Result Set data in csv format, you can export data, manipulate it in a csv editor, then reimport the edited file.

To export Result Set data in CSV format:

- Right-click the Result Set table, then choose **Export to CSV**.

To import the edited data,

- Right-click the Result Set table, then choose **Import from CSV**. *Note that any existing entries in the repository will be overwritten upon import.*

## Dos and Don'ts

When editing or extending SQL data sets:

- Avoid editing recorded JDBC URLs. They must exactly match the JDBC URLs that the database is configured with.
- If you add any SQL queries, set the parameters (if any) and result set (if any).
- You can use expressions as parameter matching criteria in SQL Templates, SQL Parameters, and Result Sets. For details, see [Using Criteria Expressions to Match Values](#).
- If you want to adjust timing, you can modify response times as described in [Modifying Response Times](#).

Note that existing records from SQL data sets can't be reused.

## Editing Data Stored in a CSV File

The Queries panel will display all the SQL queries recorded. For each SQL Query, there may be parameters (values in WHERE clauses, etc). To see the result sets and parameters associated with a specific SQL query, select that query.

The result set files will display in the **Parameter Criteria** table.

▼ **Queries**

SQL Template
SELECT id, first_name, last_name, address, city, state, zip_code, phone_number, ssn, username, password FROM Account WHERE customer_id = \${customer_id}
SELECT id, customer_id, type, balance FROM Account WHERE customer_id = \${customer_id}
SELECT id, customer_id, type, balance FROM Account WHERE id = \${id}
SELECT id, account_id, type, date, amount, description FROM Transaction WHERE account_id = \${account_id}
SELECT id, account_id, type, date, amount, description FROM Transaction WHERE id = \${id} ORDER BY date
SELECT id, account_id, type, date, amount, description, MONTH(date) as month FROM Transaction WHERE

▼ **Parameter Criteria**

id	ResultSet File	Additional Response Delay
12345	database_mydb\data_oi784q.csv	0
12456	database_mydb\data_oi6a2r.csv	0
12567	database_mydb\data_oi5c0s.csv	0

To edit the SQL templates, use the controls in the **Queries** panel. You can add or remove entries as needed.

▼ **Queries**

SQL Template
ResultSetMetaData: SELECT MAX(date) FROM News
SELECT MAX(date) FROM News
SELECT id, date, headline, story FROM News WHERE date = \${date} ORDER BY id DESC
SELECT id, date, headline, story FROM News ORDER BY id DESC
SELECT id, first_name, last_name, address, city, state, zip_code, phone_number, ssn, username, password FROM Account WHERE customer_id = \${customer_id}
SELECT id, customer_id, type, balance FROM Account WHERE customer_id = \${customer_id}

To edit result sets and parameter criteria, first select the correlated query. The name of the associated CSV file will then display in the **Parameter Criteria** area. These CSV files are stored within the database\_recorded\_data folder inside the VirtualAssets project. To edit the result set values, edit those CSV files.

## ▼ Queries

### SQL Template

ResultSetMetaData: SELECT MAX(date) FROM News

SELECT MAX(date) FROM News

SELECT id, date, headline, story FROM News WHERE date = \${date} ORDER BY id DESC

SELECT id, date, headline, story FROM News ORDER BY id DESC

SELECT id, first\_name, last\_name, address, city, state, zip\_code, phone\_number, ssn, username, password FROM

SELECT id, customer\_id, type, balance FROM Account WHERE customer\_id = \${customer\_id}

Add

Remove

## ▼ Parameter Criteria

date	ResultSet File	Additional Response Delay
2010-09-13 00:00:00.0	database_mydb\data_1c2mkp6.csv	0

To edit parameters, modify them directly in the Parameter Criteria area.

## ▼ Parameter Criteria

date
2010-09-13 00:00:00.0

## Using Criteria Expressions to Match Values

To configure the tool to use expressions as parameter matching criteria, you can use criteria expressions syntax, which supports comparing strings and numbers as well as matching strings using wild-cards and regular expressions. This is described in [Criteria Expressions for Matching Values](#).

For example, the following configuration is set to match the exact salary of 80,000 to one ResultSet file and the exact salary of 100,000 to another.

Salary	ResultSet File
80000	database_nlkr26\data_1kv80b...
100000	database_nlkr26\data_fo3pp8...

You could use criteria expressions to match all salaries up to 80,000 to one ResultSet file, match all salaries between 80,000 and 100,00 to another, and match all salaries above 100,000 to a third ResultSet File. Or, you could use [\*] in the SQL Template area to create a "catch all" for unmatched SQL queries.

▼ **Queries**

SQL Template
select firstnme, lastname, salary from EMPLOYEE where Salary>\${Salary}
[*]

Add Remove

	JDBC URL	SQL Template	SQL Parameters
2db: 0	jdbc:db2://devel198.parasoft.co...	select firstnme, lastname, sal...	SQL Parameters{1} ...
2db: 1	jdbc:db2://devel198.parasoft.co...	2	SQL Parameters{0} ...
2db: 2	jdbc:db2://devel198.parasoft.co...	[*]	SQL Parameters{0} ...

## Modifying Response Times

You can modify the SQL Responder to reflect different database response times—for instance, to reflect realistic database performance or to simulate how performance might vary under different conditions (such as the size of database and tables, the number of tables used in executing the query, the existence of indexes, and server load).

If the SQL Responder is triggered to use a result set with an additional response delay, it will pause for the amount of time specified in the **Additional Response Delay (ms)** column—plus any additional time specified in the virtual asset's performance profiles, which are described in [Working with Performance Profiles](#)—before it returns the result set. The time specified in the **Additional Response Delay (ms)** column is a per query delay. For example, if you specify a delay of 5000 ms here and two queries are executed, the additional delay will be 10,000 ms.

Note that additional response delays apply to all queries—including metadata queries.

## Repository Data

If the data is stored in a repository data source, response time adjustments can be made by altering the **Additional Response Delay (ms)** column value in the SQL data set (under SQL Parameters).

**Data Repository**

▶ [testImportOracle] ▶ testImportOracle: 1 ▶ SQL Parameters: 0 ▶

ResultSetMetaData: select:select e.employee\_id, e.first\_name, e.last\_name, cursor(select d.email from EMPLOYEES d where d.employee\_id = e.employee\_id) email from EMPLOYEES e where salary < \${salary};row=\${row}&column=email

	row	salary	Result Set	Additional Response Delay (ms)
SQL Parameters: 0	1	2500	Result Sets{20} ...	1000
SQL Parameters: 1	2	2500	Result Sets{20} ...	2000
SQL Parameters: 2	3	2500	Result Sets{20} ...	3000
SQL Parameters: 3	4	2500	Result Sets{20} ...	4000
SQL Parameters: 4	5	2500	Result Sets{20} ...	5000

## CSV Data

If the data is stored in a CSV file, response time adjustments can be made by altering the **Additional Response Delay (ms)** column value in the Parameter Criteria panel.

**Parameter Criteria**

Salary	ResultSet File	Additional Response Delay (ms)
250000	database_nlkr26\data_1rn844j.csv	2000

## Chaining Tools to the Responder's SQL Query or Result Set

You can chain tools to a SQL Responder's incoming request (SQL Query) or outgoing response (Result Set) as follows:

1. Right-click the Virtual Asset Explorer node to which you want to add this tool.
2. Choose **Add Output**.

3. Select the desired output type on the left and the desired tool on the right. For example, if you want a custom tool to perform some action on the query, you would select Incoming Request> SQL Query on the left, then the appropriate tool on the right.
