Web Functional Testing

The following exercises demonstrate how to use SOAtest to perform functional testing on the Web interface. It covers:

Introduction

Web interface testing is difficult to automate. Teams often abandon automated testing in favor of manual testing due to too many false positives or too much effort required to maintain the test suites.

SOAtest facilitates the creation of automated test suites that are reliable and dependable. Its ability to isolate testing to specific elements of the Web interface eliminates noise and provides accurate results.

SOAtest isolates and tests individual application components for correct functionality across multiple browsers without requiring scripts. Dynamic data can be stubbed out with constant data to reduce test case noise. Validations can be performed at the page object level as well as the HTTP message level. SOAtest also verifies the client-side JavaScript engine under expected and unexpected conditions through asynchronous HTTP message stubbing.

Cross-browser Testing and Validation Video Overview

</p><h1 id="WebFunctionalTesting-RecordinginaBrowser">Recording in a Browser</h1><p>Before performing the following exercises, ensure that you have started the ParaBank Server (as described in Setting Up ParaBank) and that you can navigate successfully to the default address (localhost:8080/parabank). Close the browser window after you verify this.</p><p>To record in a browser:</p>
Right-click the project from the previous exercises, then choose Add New> Test (.tst) File from the shortcut menu.

Enter a name for the file, then click Next.
Select Web> Record web scenario and click Next.

<img class="confluence-embedded-image" src="/download/attachments/29418256/RecordWebScenario.png?version=1&modificationDate=1519077203668&api=v2" data-image-src="/download/attachments/29418256/RecordWebScenario.png?version=1&modificationDate=1519077203668&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418276" data-linked-resource-version="1" data-linked-resource-type="attachment" data-linked-resource-default-alias="RecordWebScenario.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id="29418256" data-linked-resource-container-version="1">

In the first Record Web Scenario wizard page, ensure that Record new web scenario is selected, then click Next.

<img class="confluence-embedded-image" src="/download/attachments/29418256/RecordNewWebScenario.png?version=1&modificationDate=1519077203654&api=v2" data-image-src="/download/attachments/29418256/RecordNewWebScenario.png?version=1&modificationDate=1519077203654&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418275" data-linked-resource-version="1" data-linked-resource-type="attachment" data-linked-resource-default-alias="RecordNewWebScenario.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id="29418256" data-linked-resource-container-version="1">

Complete the next Record Web Scenario wizard page as follows:
Enter <code>Web Functional Testing </code> in the Test Suite Name field.
<p>Enter <code>localhost:8080/parabank</code> in the Start Recording From field.</p><div class="confluence-information-macro confluence-information-macro-information"><div class="confluence-information-macro-body"><h3 id="WebFunctionalTesting-InternetExplorerNote">Internet Explorer Note</h3><div>If you will be using Internet Explorer to record/playback this test, use the name of the local machine instead of <code>localhost</code>—here and throughout this tutorial lesson.</div></div></div>
Ensure that the following options are checked, and the others are not:
Generate Functional Test
Generate Asynchronous Request Tests.

<img class="confluence-embedded-image" src="/download/attachments/29418256/RecordFromAStartingTesting.png?version=1&modificationDate=1519077203641&api=v2" data-image-src="/download/attachments/29418256/RecordFromAStartingTesting.png?version=1&modificationDate=1519077203641&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418274" data-linked-resource-version="1" data-linked-resource-type="attachment" data-linked-resource-default-alias="RecordFromAStartingTesting.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id="29418256" data-linked-resource-container-version="1">

Click the Finish button. The test will begin, and a browser window will open.
Within the browser window that opens, perform the following actions:
Type <code>john</code> in the Username field.
Type <code>demo</code> in the Password field.
Click Log In.

<img class="confluence-embedded-image" src="/download/attachments/29418256/login.png?version=1&modificationDate=1519077203577&api=v2" data-image-src="/download/attachments/29418256/login.png?version=1&modificationDate=1519077203577&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418269" data-linked-resource-version="1" data-linked-resource-type="attachment" data-linked-resource-default-alias="login.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id="29418256" data-linked-resource-container-version="1">

Click the first account number listed in the Accounts Overview page (12345).

<span class="confluence-embedded-file-wrapper"><img class="confluence-embedded-image" src="/download/attachments/29418256/12345.jpg?version=1&modificationDate=1519077203405&api=v2" data-image-src="/download/attachments/29418256/12345.jpg?version=1&modificationDate=1519077203405&api=v2" data-unresolved-comment-

count="0" data-linked-resource-id="29418257" ... Click **Log Out**.

Close the browser to end recording. In the Test Case Explorer view, SOAtest creates a new .tst file and a test suite that contains the scenario that you just recorded.

- Expand the new test suite node in the Test Case Explorer to view the tests created for each user action taken during the recording.

Adding a Data Source

To add a data source:

1. Right-click the **Scenario: Web Functional Testing** node, then choose **Add New> Data Source** from the shortcut menu.

2. In the New Project Data Source wizard, select **Table** and click **Finish**.

A new **Data Sources** node is added to the **Scenario: Web Functional Testing** branch.

3. In the New Datasource table configuration panel that is opened in the right side of the GUI, make sure the **First row specifies column** names check box is checked.

4. Enter `Account Number` in the top cell in column A. In the same column, enter `12345` in row 1 and `13344` in row 2.

5. Click **Save** to save the changes.

Parameterizing a Form Input

To parameterize an action:

1. Expand the **Scenario: Web Functional Testing** branch to view the recorded actions related to clicking the account number.

2. Double-click the **Test 3: Click "12345"** node to open the test configuration panel.

3. Note that the **Pre-Action Browser Contents** tab shows what the page looked like before the test action (clicking '12345') was performed. It uses a blue border to highlight the user actionfor this test.

4. In the test configuration panel, open the **User Action** tab.

5. Under the Element Locator section, change **Attribute value** from **Fixed** to **Parameterized**.

6. Select **Account Number** from the menu that appears to the immediate right.

7. Click **Save** to save the changes.

8. Run the test. It will now click on the <a> element that has been parameterized with the account number entered in the data source.

Configuring Validation on a Page Element

To configure a validation on a page element:

1. Fully expand the **Scenario: Web Functional Testing** branch.

2. Double-click the Browser Contents Viewer node under **Scenario: Form login> Test 3: Click 'Log In'**.

3. In the Browser Contents Viewer configuration panel, right-click the dollar amount text that appears next to account 12345 (-$2300.00) and select **Extract Value from <TD> element** from the shortcut menu.

4. In the dialog that opens, ensure that the **text** property is selected in the **Property name** box, then click **Next**.

5. Complete the next page as follows:
   1. Check **Isolate partial value using text boundaries** box.
   2. In the **Left-hand text** field, enter `-$`. You will see that the 'Preview of Value to Validate…' text now contains only the dollar amount. The Left-hand text that you added removes the dollar sign from the validation, allowing you to focus on validating the actual amount.

/attachments/29418256/IsolatePartial.png?version=1&modificationDate=1519077203564&api=v2" data-image-src="/download/attachments /29418256/IsolatePartial.png?version=1&modificationDate=1519077203564&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418268" data-linked-resource-version="1" data-linked-resource-type="attachment" data-linked-resource-default-alias="IsolatePartial.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id="29418256" data-linked-resource-container-version="1">

Click Next.
Ensure that Validate the value is selected, and that the expected text is displayed on the rendered page.

<img class=" confluence-embedded-image" src="/download/attachments/29418256/Validate.png?version=1&modificationDate=1519077203760&api=v2" data-image-src="/download/attachments/29418256/Validate.png?version=1&modificationDate=1519077203760&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418282" data-linked-resource-version="1" data-linked-resource-type="attachment" data-linked-resource-default-alias="Validate.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id=" 29418256" data-linked-resource-container-version="1">

Click Finish. A Browser Validation Tool will be added to this test. As the red highlight indicates, it is set up to check that the element you selected remains the same as the application evolves.

<img class="confluence-embedded-image" src="/download/attachments/29418256/PostAction.png? version=1&modificationDate=1519077203628&api=v2" data-image-src="/download/attachments/29418256/PostAction.png?version=1& modificationDate=1519077203628&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418273" data-linked-resource-version=" 1" data-linked-resource-type="attachment" data-linked-resource-default-alias="PostAction.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id="29418256" data-linked-resource-container-version="1">
<h1 id=" WebFunctionalTesting-ConfiguringaBrowserStub">Configuring a Browser Stub</h1><p>A stub is static data that SOAtest saves when recording a web scenario. Stubbing helps to verify that any changes to the client-side code do not affect the final resultant html page by feeding unchanging data to the client in place of the actual server response.</p><p>To configure a browser stub:</p>
Expand the Scenario: Web Functional Testing< /strong> branch.
Right-click Scenario: Form login> Test 3: Click 'Log In' and choose Add Output from the shortcut menu.

<img class="confluence-embedded-image" src="/download/attachments /29418256/AddOut.png?version=1&modificationDate=1519077203457&api=v2" data-image-src="/download/attachments/29418256/AddOut.png? version=1&modificationDate=1519077203457&api=v2" data-unresolved-comment-count="0" data-linked-resource-id="29418260" data-linked-resource-version="1" data-linked-resource-type="attachment" data-linked-resource-default-alias="AddOut.png" data-base-url="https://docs.parasoft.com" data-linked-resource-content-type="image/png" data-linked-resource-container-id="29418256" data-linked-resource-container-version="1">

In the Add Output wizard that opens, choose HTTP Traffic, then click Next.

In the Response Body section of the Browser Stub configuration view (opened on the right side of the GUI), change the dollar amount in the table from its existing value of -$2300 to $1000.00.
The easiest way to do this is to copy the entire text in the Response Body into a text editor (e.g. Notepad), use its search capability to find the previous dollar amount, modify the value, and then copy all the text from the editor and replace the current contents in the Response Body.
This response body will be provided in place of the actual server response when the recorded scenario is run later in this example.
