

# Application Coverage

dotTEST allows you to collect coverage information for standalone and web applications. The monitored application can be installed on the same machine where dotTEST is installed, or on another machine.

Ensure that the Visual C++ Redistributable Packages that are shipped with dotTEST are installed on the machine where the monitored application will be run. They are automatically installed when you install dotTEST with the wizard (see [Installation](#)). If you install dotTEST from a ZIP distribution, or if you are going to collect coverage on another machine, install the packages manually by running the executables located in the `[INSTALL_DIR]\bin\prerequisites` directory.

Additionally, collecting coverage from web applications requires the `LoadUserProfile` option to be set to `true` in the ISS Management Console.
