

Customizing Console Verbosity

To modify the level of detail reported in the Console:

1. Click **Parasoft** in the menu bar and choose **Options**.
2. Select **Console**.
3. Set your console output settings. Options are:
 - **Low**: Configures the Console view to show errors and basic information about the current step's name and status (done, failed, up-to-date).
 - **Normal**: Adds command lines and issues reported during test and analysis.
 - **High**: Uses full-format violation listings and also reports warnings.
 - **Show console on any change**: Determines whether the console is brought to the front any time its content changes.

The screenshot shows a dialog box titled "Console". It contains a section for "Output verbosity level" with three radio button options: "High", "Normal", and "Low". The "Normal" option is selected. Below this section is a checked checkbox labeled "Show console on any change".
