

# Importing the Jtest Example Projects

Jtest ships with sample projects that can help you become familiar with the Jtest capabilities. The projects can be imported from [INSTALL\_DIR]/examples.

 The Jtest example projects require Java SE 1.7 or higher.

If you use Eclipse IDE, you can conveniently create the sample projects with the Jtest wizard:

1. Go to **File > New > Other...** in the Eclipse bar.
2. Expand **Jtest** and select the project you want to create.

3. Click **Next**.
4. Configure the project name and location:

5. Click **Finish**.

The project will be created and displayed in the Package Explorer as one of the available projects.
