

Getting Started with Parasoft Recorder

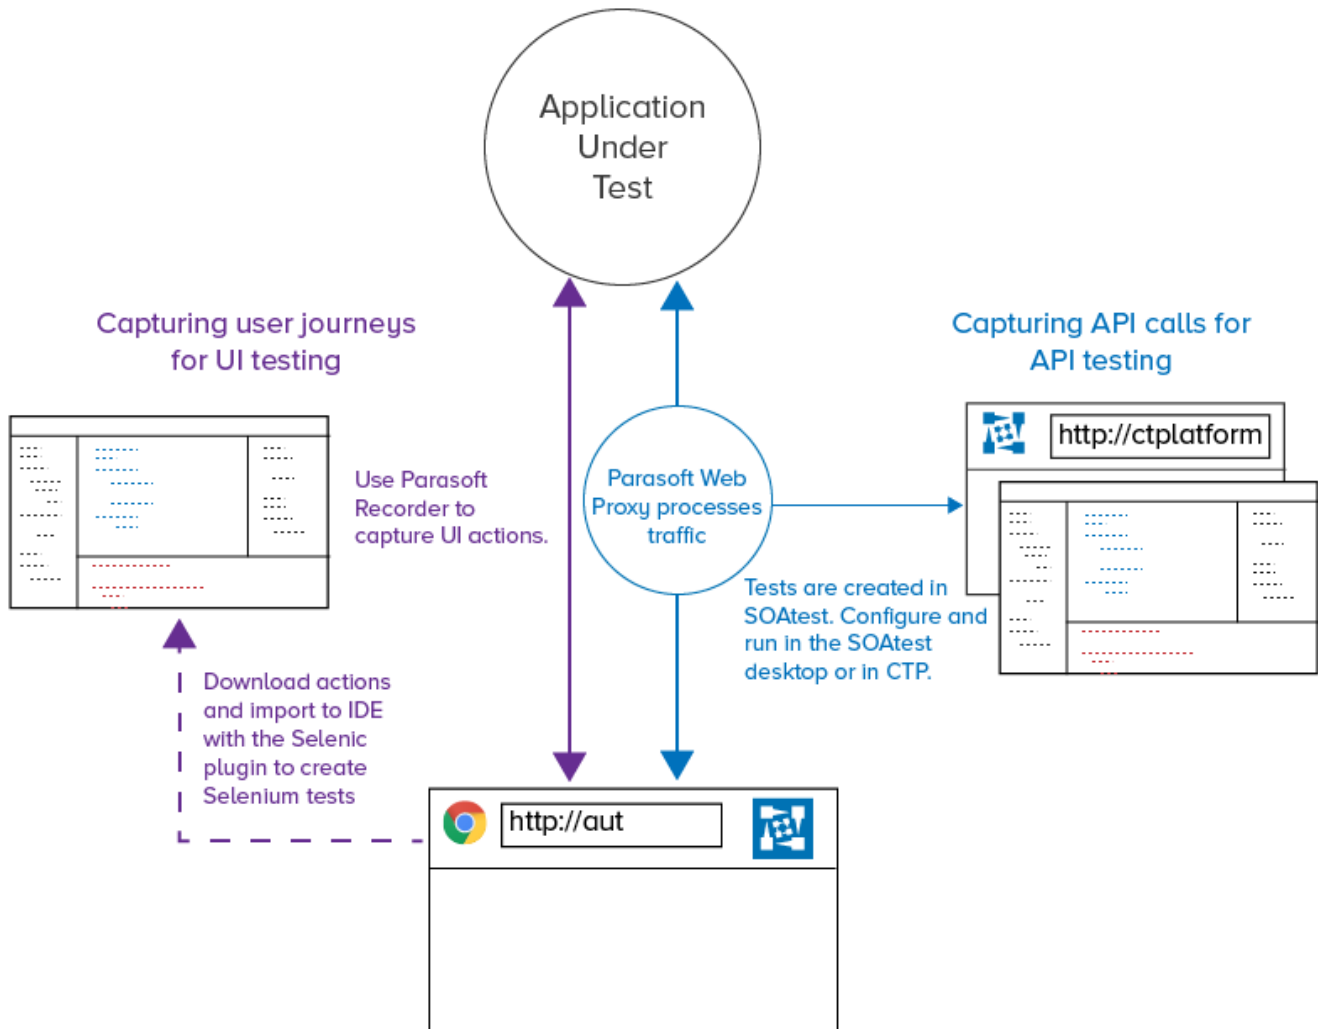

Parasoft Recorder can record API calls and user actions during interactions with a web application. You can convert the API traffic into API tests that you can extend and execute in CTP or the SOAtest desktop. You can download the recorded user actions and convert them into Selenium tests with [Parasoft Selenic](#). In this section:

- [Overview](#)
- [System Requirements](#)
- [Licensing](#)
- [Installation](#)
- [Starting the Web Proxy](#)
- [Configuring the Browser Extension](#)

Overview

Parasoft Recorder includes the following components:

- Parasoft Recorder Chrome extension: The Chrome browser extension is installed on the local machine and provides an interface for starting/stopping recording, as well as configuring your connection to SOAtest so that the SOAtest Web Proxy can convert API traffic into tests.
- SOAtest Web Proxy: The proxy is installed on the local machine, processes traffic, and creates a .tst file in SOAtest.
- Parasoft Root Certificate Authority: The CA enables HTTPS traffic to be recorded.

System Requirements

This section describes the requirements for Parasoft Recorder components and associated functionality.

Browser Extension

- Latest version of Google Chrome
- The SOAtest Web Proxy must also be running to record API traffic.

SOAtest Web Proxy

- Port 40090 must be available to run the web proxy.

Generating API Tests

- SOAtest desktop or server 9.10.5 or later

Creating and Managing Selenium Tests

- Refer to the [System Requirements](#).

Licensing

You can freely download and install Parasoft Recorder, but a valid license is required to use the API test generation features in SOAtest or the Selenium test creation and management features in Parasoft Selenic. Contact your Parasoft representative for complete licensing information.

API Testing License

Advanced Test Generation license feature in SOAtest is required to record traffic and generate tests. The following license options are available:

- Advanced Test Generation Desktop: Enables you to create assets from the web proxy on the same machine where SOAtest is installed. Connections from remote machines are not allowed.
- Advanced Test Generation 5 Users: Up to five users can create assets from any machine that can connect to the SOAtest server.
- Advanced Test Generation 25 Users: Up to 25 users can create assets from any machine that can connect to the SOAtest server.
- Advanced Test Generation 100 Users: Up to 100 users can create assets from any machine that can connect to the SOAtest server.

Selenium Test License

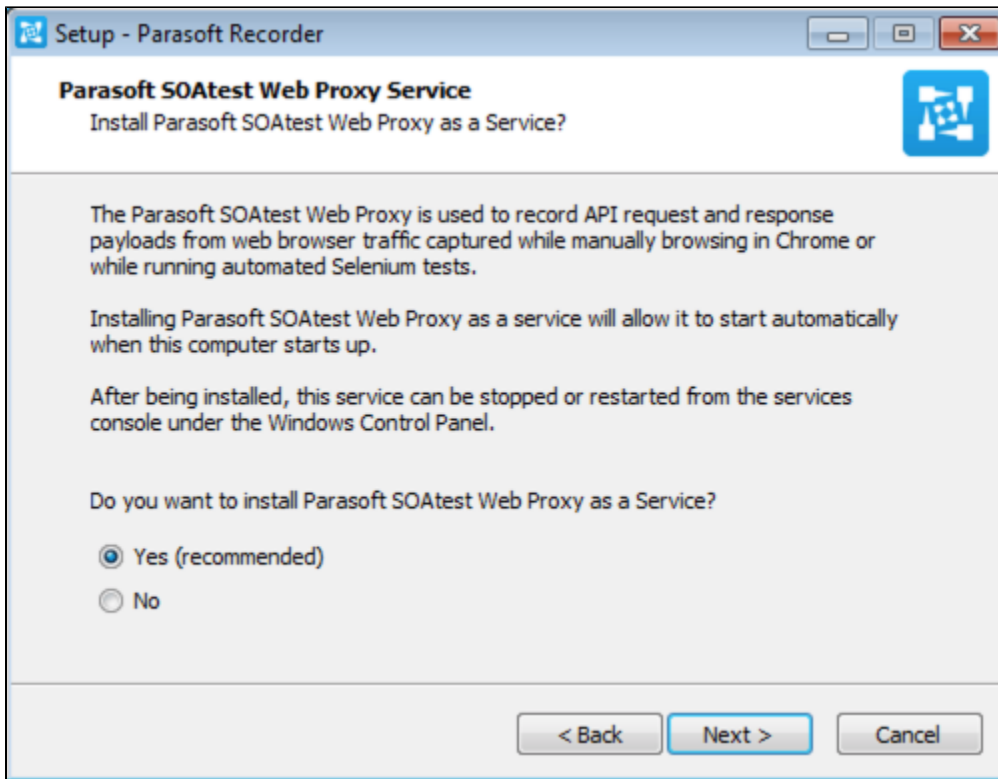

Refer to the [Parasoft Selenic documentation](#) for details about licensing.

Installation

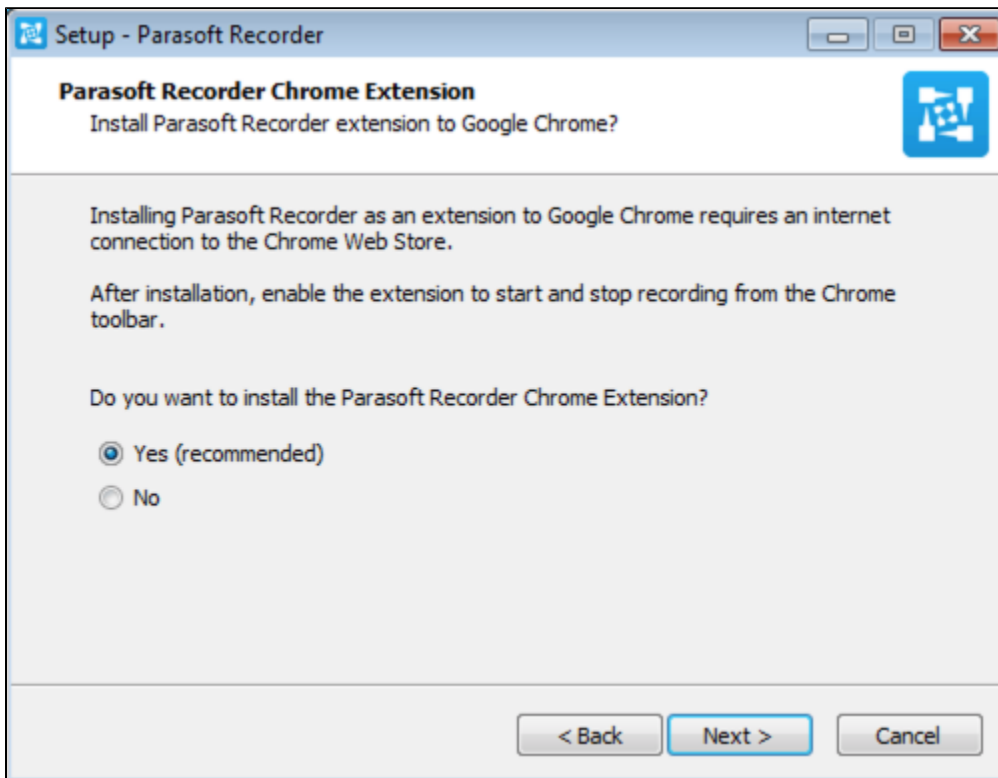

Run the parasoft_recorder_<version>_win32.exe file for installation on Windows or the parasoft_recorder_<version>_macos.dmg for installation on Mac OS. If Mac OS can not run the .dmg for security reasons, right-click the file and choose **Open With> Installer**.

Follow the wizard for your OS to complete the installation. See [Manual Installation](#) if you experience issues using the installer.

During Windows installation, you will be prompted to install the Parasoft SOAtest Web Proxy as a Windows service. This enables you to start and stop the proxy using the services console under the Windows Control Panel, as well as use the SOAtest Web Proxy console in the Windows Start menu (see [Starting the Web Proxy](#)). You can also manually start the proxy by running the executable JAR file (see [Manually Starting the Web Proxy](#)).

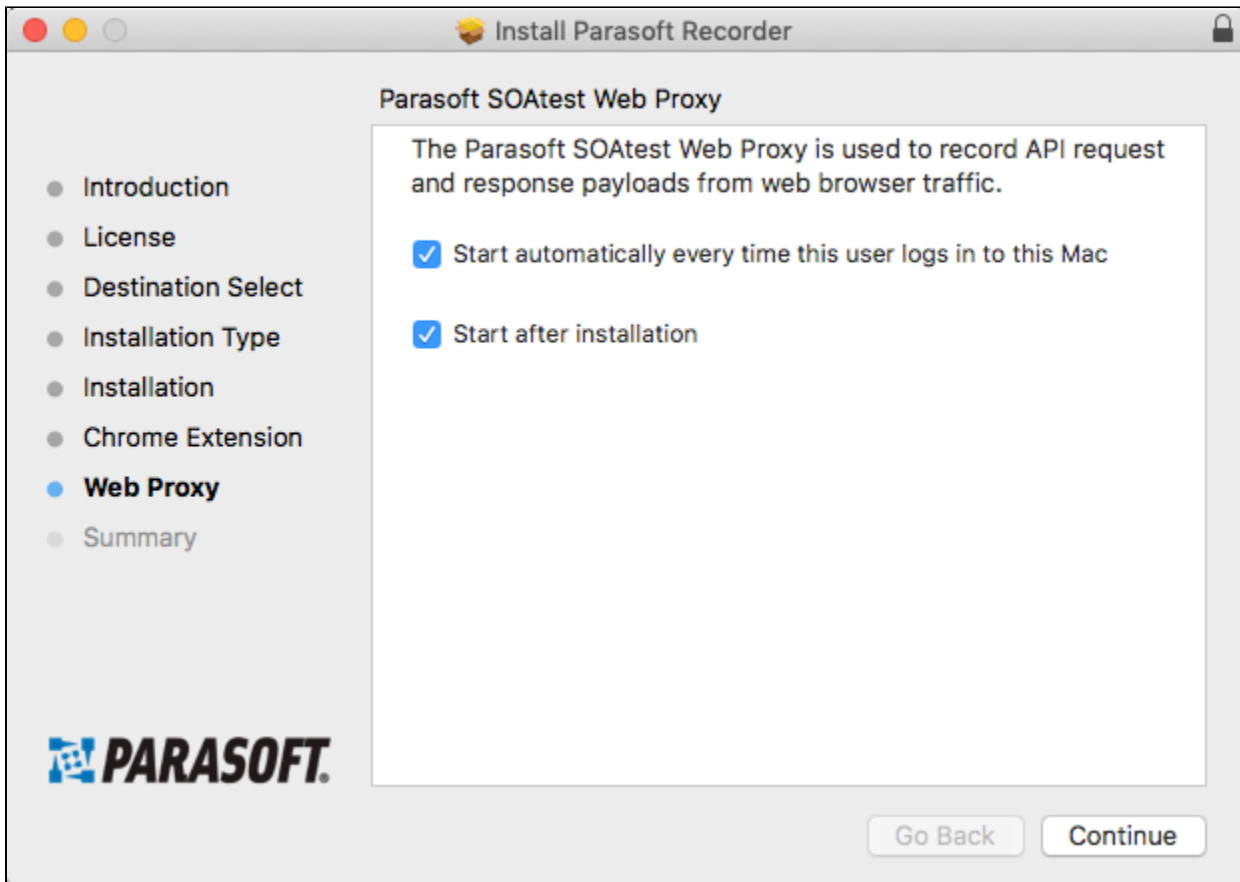

The Windows and Mac installer will also prompt you to install Parasoft Recorder from the Google Chrome store (Windows shown). See [Manual Installation](#) if access to the Google Chrome store is prohibited or if you experience issues using the installer.

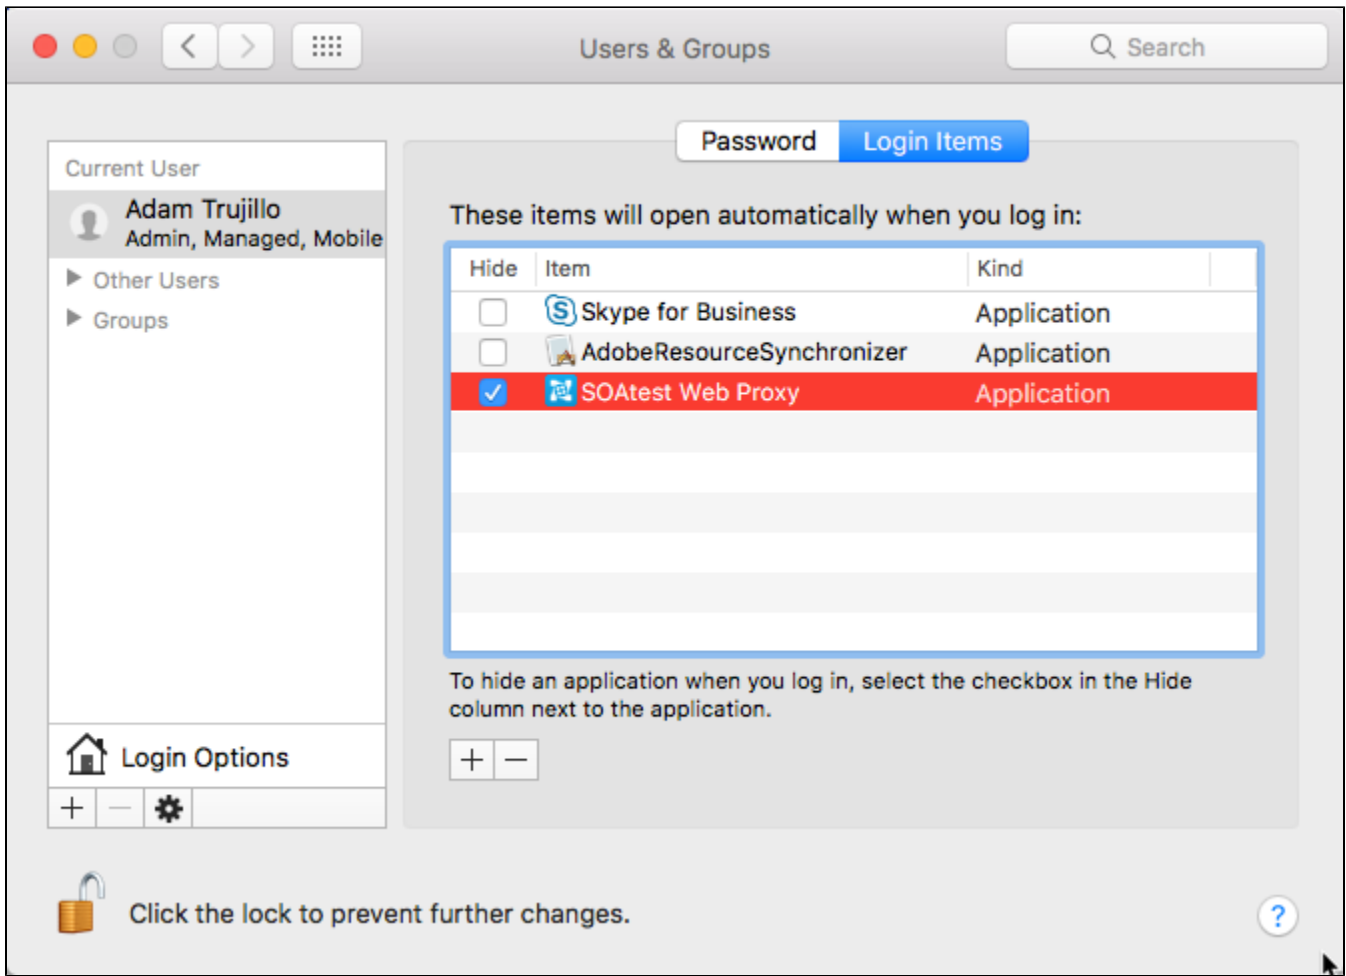

The installer will prompt you to install the Parasoft Root Certificate Authority if it is not detected. The CA is required to record traffic over HTTPS. The CA is normally installed along with the SOAtest/Virtualize desktop application. You can also add the CA manually (see [Installing the Parasoft Root Certificate Authority](#)).

During installation on Mac OS, you can enable the web proxy to automatically start whenever you log into the machine.

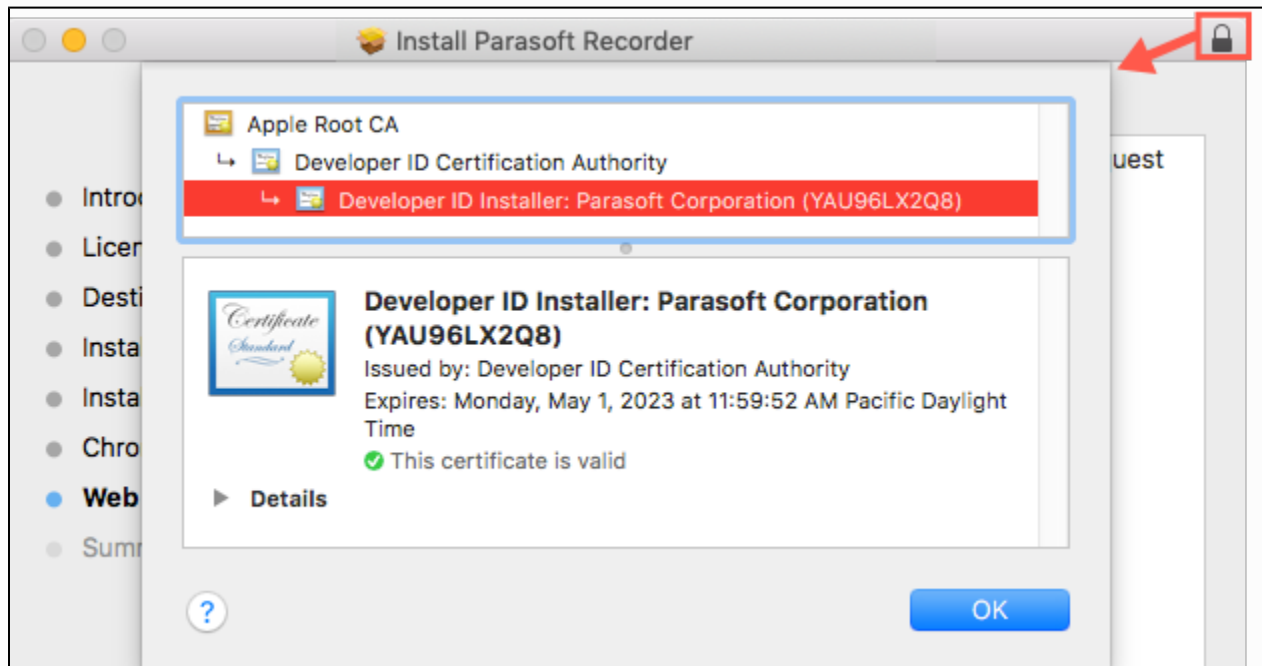

You can enable or disable automatic start up for the web proxy after installation by in the **System Preferences> Users & Groups> Login Items** settings.

Viewing the Developer ID Certificate Authority

You can click the padlock icon to view the Apple developer ID certificate authority (CA). The certificate identifies Parasoft as a trusted source of software for Apple devices.

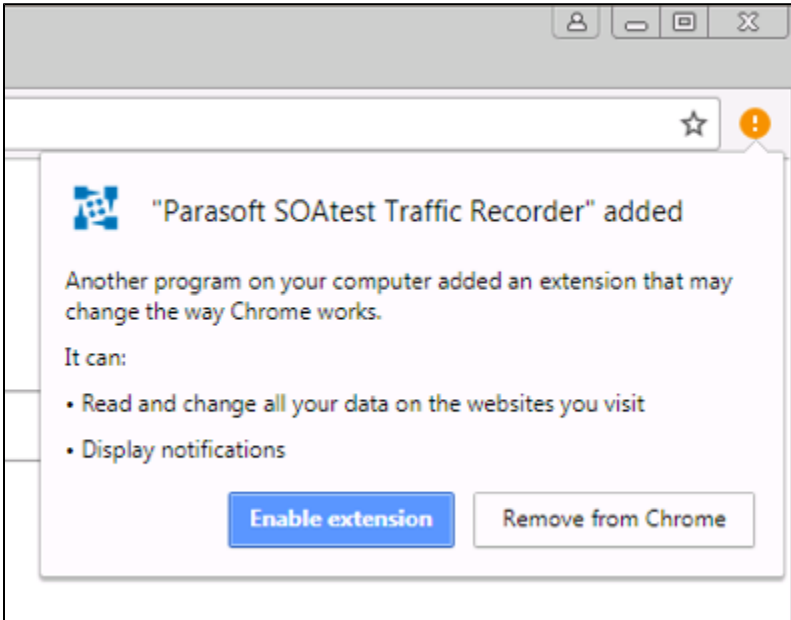

After the installer finishes, you will be prompted to enable the extension when you launch Chrome.

Do not click Remove from Chrome.

This action will uninstall and blacklist the extension. As a result, you will not be able to install or update the extension automatically. You will need to uninstall and reinstall Chrome in order to restore the automatic installation of this extension.

The installer will prompt you to start the Parasoft SOAtest Web Proxy when the installation completes. If you choose to finish the installation without starting the proxy, see [Starting the Web Proxy](#) for instructions on starting the proxy on demand. If the proxy is running, see [Using the Browser Extension](#) for next steps. The SOAtest server must be running before you can use the extension.

Uninstalling the Browser Extension and Proxy

Use the regular Windows program uninstaller in the control panel to fully uninstall the tool. The Mac OS installer ships with an **Uninstall Parasoft Recorder Generator** utility that you can run if you wish to completely uninstall the tool. The Mac OS utility will be located in your Applications/Parasoft folder.

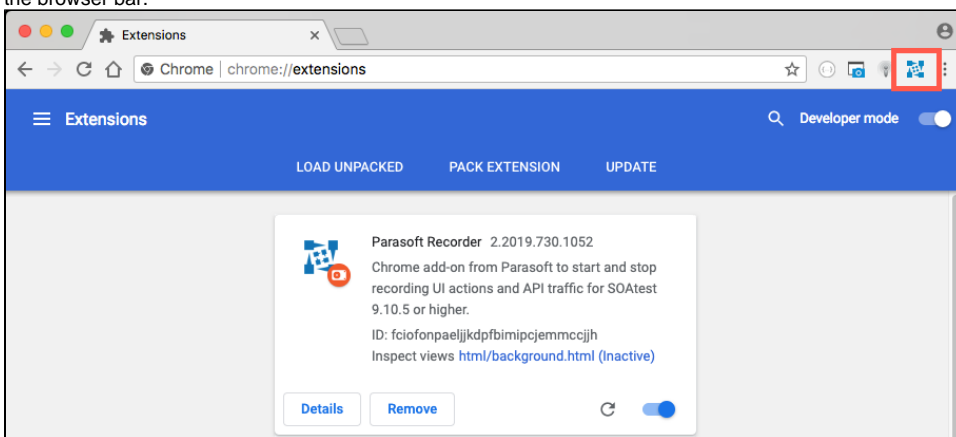

Manual Installation

The following instructions describe how to manually install Parasoft Recorder components if you are unable to use the installer.

1. Download the TrafficRecordingExtension.zip folder (contact your Parasoft representative).
2. Extract the contents of the compressed folder anywhere on your machine. No additional installation is necessary to run the Parasoft SOAtest Web Proxy.
3. Open a Chrome browser window and open the Extensions page (<chrome://extensions>).
4. Enable the **Developer mode** option and click **Load unpacked extension**.

5. Navigate to and choose the [TrafficRecordingExtension_INSTALL]/chrome-extension directory to install the extension. The tool will be available in the browser bar.

The Parasoft SOAtest Web Proxy and SOAtest server must be running before you can record API traffic (see [Starting the Web Proxy](#)). If the SOAtest server is running and the default configuration is used to start the proxy, you will be able to start using the extension to record traffic. See [Parasoft Recorder Usage](#) if these components are running. You will also need to configure connections to the Parasoft SOAtest Web Proxy and SOAtest server once the browser extension is installed.

Installing the Parasoft Root Certificate Authority

The Parasoft Root Certificate Authority must be installed as a trusted certificate to enable recording of HTTPS traffic. If the certificate authority is not installed, the browser will not consider the connection secure and may refuse to allow the connection.

Windows

The Parasoft Root Certificate Authority is normally installed automatically by both the SOAtest Windows installer and the Parasoft Recorder installer. You can also run `soatestcli` with the `-installcertificate` option to manually install it if necessary. For example:

```
soatestcli -installcertificate
```

If SOAtest is not installed on the local machine, you can manually add the certificate to Chrome:

1. Open the Chrome settings page (<chrome://settings>) and expand the **Advanced** section.
2. Click **Manage certificates** in the Privacy and security section.
3. Click the **Trusted Root Certification Authorities** tab in the Certificates dialog.
4. Click **Import** to click Next when the Certificate Import Wizard opens.
5. Browse to the [TrafficRecordingExtension_INSTALL]/parasoft.cer file and click **Next**.
6. Verify that the wizard will place the certificate in the Trusted Root Certification Authorities folder and click **Next**.
7. Click **Finish** and confirm that you want to add the Parasoft Root Certificate Authority if prompted.

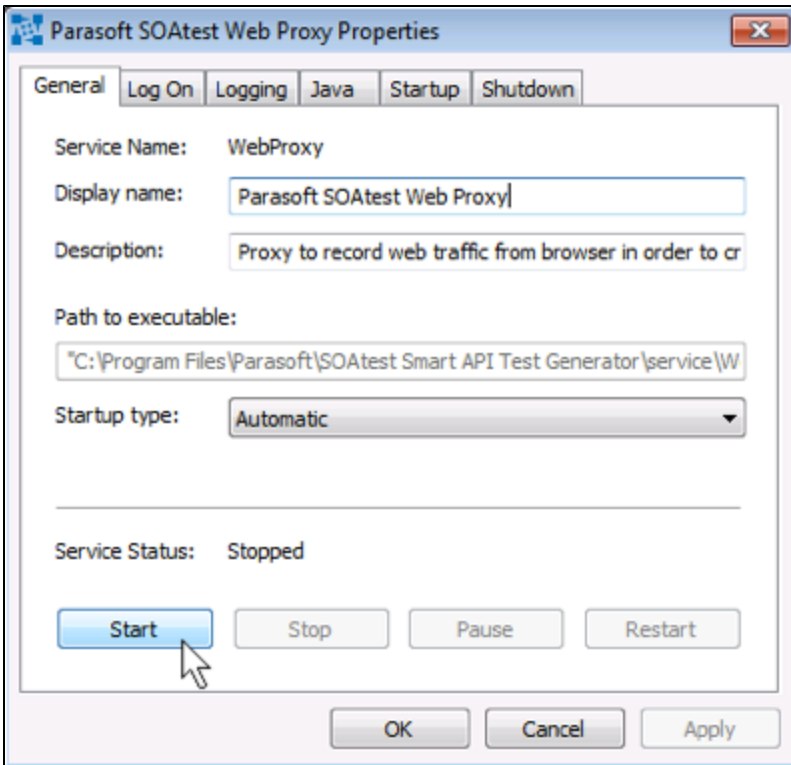

Mac OS

1. Open the Chrome settings page (<chrome://settings>) and expand the **Advanced** section.
2. Click **Manage certificates** in the Privacy and security section. The Keychain Access application will open.
3. Choose **login** under Keychains and choose **Certificates** under Category.
4. Choose **File> Import items** and navigate to parasoft.cer in the [TrafficRecordingExtension_INSTALL] directory.
5. Right-click the Parasoft Root Certificate Authority when it appears and choose **Get Info**.
6. Expand the Trust section and choose **Always Trust** from the **When using this certificate** drop-down menu.
7. Enter your credentials when prompted to save the configuration.

Starting the Web Proxy

If you installed the Parasoft Web Proxy as a Windows service, you can use the SOAtest Web Proxy console to start and stop the proxy.

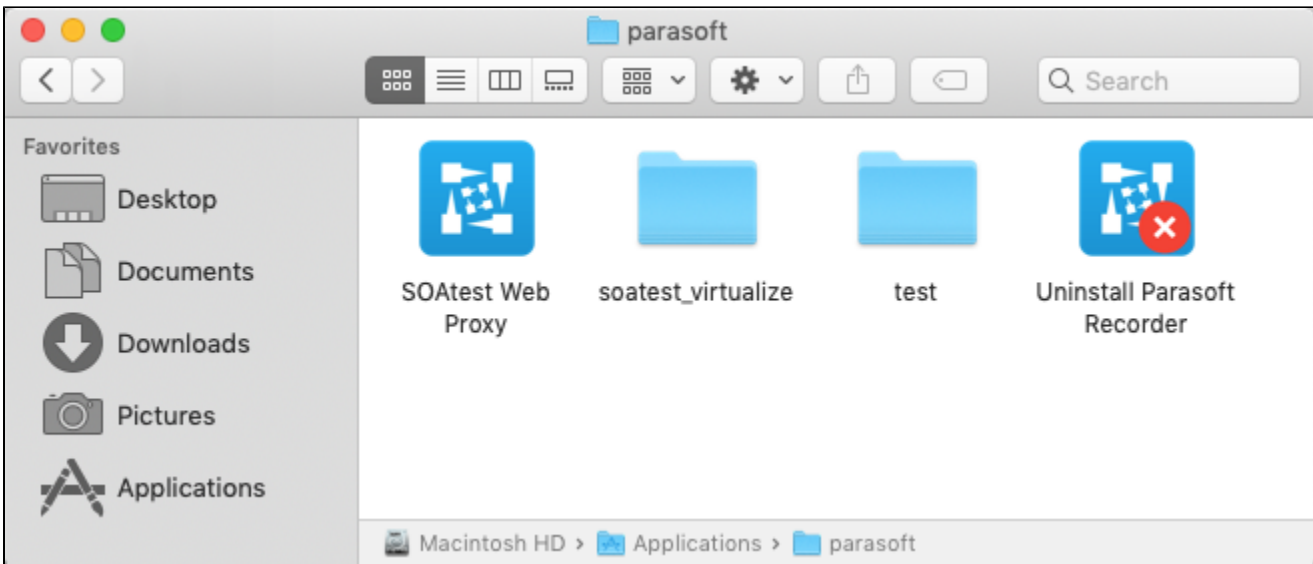

1. Choose **SOAtest Web Proxy** from the Windows Start menu or double-click the desktop icon (if you chose this option during installation).
2. Click **Start** in the General tab.

The web proxy API will be started on port 40090 by default. The proxy port used for recording API traffic will be assigned by scanning for open ports starting with port 40443. You can configure port numbers and other options when starting the proxy in the web proxy console. See [Advanced Parasoftware Recorder Configuration](#) for additional information.

Open the console and click **Stop** to shutdown the proxy.

On Mac OS, the web proxy will be located in your Applications/Parasoftware folder.

Manually Starting the Web Proxy

The web proxy is a JAR file that you can run with the `java` command:

```
%INSTALLDIR%/jre/bin/java -jar com.parasoftware.traffic.proxy.jar
```

Java Support

Parasoftware Recorder ships with its own instance of Java, but you can use any Java 8 or later that is already installed on your system.

The web proxy API will be started on port 40090 by default. The proxy port used for recording will be assigned by scanning for open ports starting with port 40443. You can specify system properties to configure port numbers and other options when starting the proxy. See [Advanced Parasoft Recorder Configuration](#) for additional information.

Checking the Web Proxy Version

Execute the JAR file with the `--version` argument (`-v` shorthand) to print the version number on the command line. Example:

```
%INSTALLDIR%/jre/bin/java -jar com.parasoft.traffic.proxy.jar --version
```

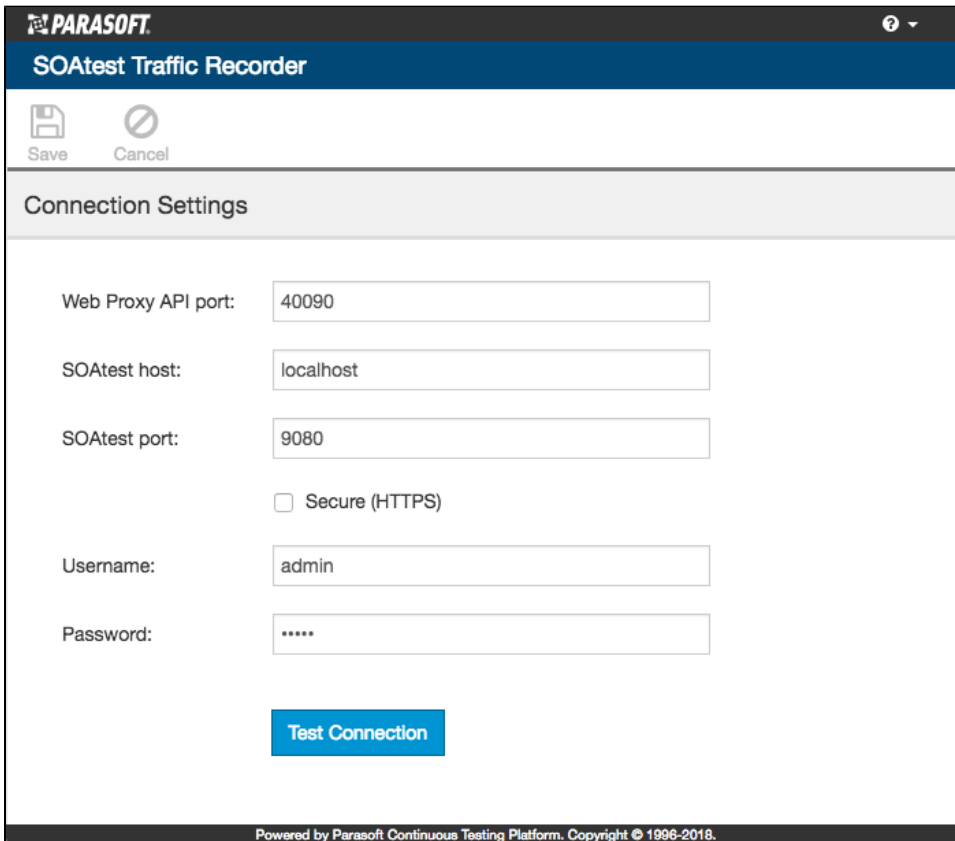

The version number can be helpful if you need to troubleshoot issues with Parasoft Recorder.

Executing the JAR with this argument only enables the proxy to report the version and does not start the proxy.

See [Advanced Parasoft Recorder Configuration](#) for additional information.

Configuring the Browser Extension

1. Right-click the Parasoft icon and choose **Options** to open the configuration settings. You can also access the configuration settings by clicking the **Options** link on the `chrome://extensions` homepage.
2. Specify the proxy API port (See [Advanced Parasoft Recorder Configuration](#)) and SOAtest server connection settings.

The screenshot shows the 'SOAtest Traffic Recorder' configuration window. At the top, there is a 'PARASOFT' logo and a help icon. Below the title bar, there are 'Save' and 'Cancel' buttons. The main section is titled 'Connection Settings' and contains several input fields: 'Web Proxy API port' (40090), 'SOAtest host' (localhost), 'SOAtest port' (9080), a checkbox for 'Secure (HTTPS)' which is unchecked, 'Username' (admin), and 'Password' (masked with dots). A blue 'Test Connection' button is located at the bottom of the settings area. The footer of the window reads 'Powered by Parasoft Continuous Testing Platform. Copyright © 1996-2018.'

Enable the **Secure (HTTPS)** option to communicate with SOAtest over HTTPS.

3. Click **Test Connection** to verify your settings and click **Save** if successful.
