

Adding a Remote Data Repository Server to the Data Repositories View

To add a remote repository to your Data Repositories view:

1. Click the **Add Server** button.

2. Specify how to connect to your Data Repository Server.

A screenshot of a configuration dialog box for adding a server. It has the following fields:

- Host: mydrserver
- Port: 2424
- Server Credentials section (expanded):
 - Username: admin
 - Password: *****

3. Click **OK**.

The specified data repository server will be added to the Data Repositories view. Any repositories that it contains will be displayed in this tree. New repositories can be added as described below, or during the process of creating a virtual asset from the "create parameterized messages from traffic wizard".

Removing a Server from the Data Repositories View

If you later want to remove a server from the Data Repositories view, just select the related node and click **Remove Server**.
