

# Other or Custom Transports and Protocols

Parasoft's Extension Framework lets you extend the product to cover any transports and message formats that are beyond the scope of Parasoft's built-in support. For example, you might want to extend the supported transports to include messaging based on proprietary APIs. You can then take advantage of Parasoft's rich interface for configuring, validating, and monitoring all the types of messages and transports that are involved in your testing.

For details, see [Using Custom Transports, Message Formats, and Tools](#).
