

Moving Assets Across Projects and Responder Suites

This topic explains how you can move assets across projects and Responder suites. The same strategies apply to action suites.

Drag and Drop

You can drag and drop tools to reorder them.

Cut/Copy and Paste

You can also cut/copy and paste assets (responders, data sources, etc.) as needed.

For example, this is useful in the following situations:

- You want to create new tools that are very similar to existing tools.
- You want to use the same asset across multiple projects or Responder suites
- You want to copy .pva files to the VirtualAssets project in order to deploy the associated virtualized assets on the Virtualize server.

Tip

If you switch to the Navigator view, you can copy/paste and drag/drop between your projects and the external file explorer of the OS.
