Configuring Localsettings

This topic explains how you can specify settings to control options for reporting, task assignment, licensing, and more. Local settings can be used to share preferences across a team as well as to apply different groups of settings to different projects and test runs.

Sections include:

- About Localsettings
 - Specifying ans Storing Localsettings
 - Additional Information
- Available Settings
 - Reporting Settings
 - Parasoft DTP Settings
 - Team Server Settings
 - Licensing Settings
 - OpenID Connect Settings
 - Technical Support Settings
 - Authorship/Scope Settings
 - Source Control Settings
 - File Encoding Settings
 - Miscellaneous Settings
- Using Variables in Local Settings (Options) Files
- Examples

About Localsettings

Localsettings can control report settings, Parasoft DTP settings, error authorship settings, and more. You may want to create a file with localsettings to:

- Configure and use different setting configurations for different projects.
- Extend or override team-wide settings as needed (for example, for settings that involve local paths).
- · Enter GUI-specified and manually-specified settings into Parasoft DTP, which centralizes preference distribution and updating across the team.
- · Adjust settings without having to open the GUI.

1 If an option is configured both in the localsettings file and in the GUI, localsettings will override the GUI configuration.

Specifying ans Storing Localsettings

There are two ways to specify localsettings:

- Enter them manually in a simple text file. There are no name or location requirements.
- · Export your GUI preferences as described in Exporting GUI Preferences to a localsettings File then adjust or extend them as needed.

Creating a Local Settings (Options) File by Exporting Your GUI Preferences

The fastest and easiest way to create options files is to export your Preferences from the GUI.

- 1. Choose Parasoft> Preferences.
- 2. Select Parasoft (the root element in the left tree).
- 3. Click the share link in the right side of the panel.
- 4. In the dialog that opens, specify which preferences you want to export to a file.
- 5. Click the Browse button, then specify the file where you want the settings saved.
- 6. Click OK.
 - If you select an existing file, the settings will be appended to that file. Otherwise, a new file will be created.
 - Exported passwords will be encrypted.

Localsettings can be stored on Parasoft DTP (where they are automatically applied to connected C/C++test installations) or in a local file (where they can be specified from the command line). For details on how to store and apply localsettings, see C++test Configuration Overview.

Additional Information

- Each setting should be entered on a single line.
- We highly recommend that you use encoded passwords to ensure successful authentication and increase the level of security; see Creating an Encoded Password.
- If you are importing preferences from localsettings specified on DTP and you want to override these settings from the GUI, you can clear the Use DTP settings option on the appropriate page, then manually configure the settings.
- If any localsettings problems are detected during a test run, details will be reported in the command line output.
- If you are running cli mode from a developer/tester desktop (as opposed to from a Server machine), use the tasks.clear=false option to
 ensure that your results from previous runs are preserved.

Available Settings

Reporting Settings

Setting	Purpose
build.id=[id]	Specifies a build identifier used to label results. It may be unique for each build but may also label more than one test sessions that were executed during a specified build.
	The default is \${dtp_project}-yyyy-MM-dd.
report. active_rules=true false	Determines if the reports contain a list of the rules that were enabled for the test.
	Default: false
report. archive=true false	Enables the generation of an additional compressed archive (.zip) file in the specified report location. The ZIP file contains all the files generated to build the report.
	This option can generate an archive for any report format (e.g., HTML, CSV, PDF, etc.).
	By generating an archive, you can also perform custom transformations of the report because all of the elements are generated to the specified destination folder.
	Default: false
report.associations=tru e false	Specifies whether the report shows requirements, defects, tasks, and feature requests that are associated with a test. Default: false
report.authors_details=	Determines whether the report includes an overview of the number and type of tasks assigned to each team member.
true false	Default: true
report.contexts_details	Determines whether the report includes an overview of the files that were checked or executed during testing.
=true false	Default: false
report.custom.	Specifies the location and extension of the XSL file for a custom format. Used with report.format=custom
report.custom.xsl.file	For details and examples, see Configuring Reporting Settings.
report.	Determines whether manager reports include details about team member tasks.
developer_errors=true f alse	Default: false
report. developer_reports=true	Determines whether the system generates detailed reports for all team members (in addition to a summary report for managers).
false	Default: true
report. format=html pdf sate xu	Specifies the report format.
nit custom	Default: html
report. generate_htmls=true fal se	Determines whether HTML reports are generated and saved on the local file system. XML reports are generated and saved regardless of this setting's value.
	Default: true
report.graph. cs_start_date=[MM/dd /yy]	Determines the start date for trend graphs that track static analysis tasks over a period of time. See Understanding Reports for more details on these reports.
report.graph. ue_coverage_start_date= [MM/dd/yy]	Determines the start date for trend graphs that track coverage over a period of time. See Understanding Reports for more details on these reports.
report.graph. ue_start_date=[MM/dd /yy]	Determines the start date for trend graphs that track test execution results over a period of time.
report. location_details=true f	Specifies whether absolute file paths are added to XML data. This needs to be enabled on the Server installation if you want to relocate tasks upon import to desktop installations.
	Default: false

report.mail. attachments=true false	Determines whether reports are sent as attachments. All components are included as attachments; before you can view an HTML report with images, all attachments must be saved to the disk.
	Default: false
report.mail.cc= [email_addresses]	Specifies where to mail comprehensive manager reports. This setting must be followed by a semicolon-separated list of email addresses. This setting is typically used to send reports to managers or architects. It can also be used to send comprehensive reports to team members if such reports are not sent automatically (for example, because the team is not using a supported source control system).
report.mail.	Specifies that you want to email a compact report or link rather than a complete report.
compact=trends links	If trends is used, the email contains a trend graphs, summary tables, and other compact data; detailed data is not included.
	If links is used, the email contains only a link to a report (which is available on Team Server)
report.mail.domain= [domain]	Specifies the mail domain used to send reports.
report.mail. enabled=true false	Determines whether reports are emailed to team members and to the additional recipients specified with the cc setting.
	Remember that each developer that worked on project code will automatically be sent a report that contains only the errors/results related to his or her work.
	Default: false
report.mail.exclude= [email_addresses]	Specifies any email addresses you do not want to receive reports. This set-ting is used to prevent automated sending of reports to someone that worked on the code, but should not be receiving reports.
report.mail.exclude. developers=true false	Specifies whether reports should be mailed to any team member whose email is not explicitly listed in the report. mail.cc property. This setting is used to prevent reports from being mailed to individual developers.
	Default: false
report.mail. format=html ascii	Specifies the email format.
	Default: html
report.mail.from=	Specifies the "from" line of the emails sent.
<pre>[email_address OR user_name_of_the_same_d omain]</pre>	Default: <global_user_name></global_user_name>
report.mail.include= [email_addresses]	Specifies the email addresses of team members that you want to receive individual reports. This setting must be followed by a semicolon-separated list of email addresses. This setting is typically used to send individual reports to team members if such reports are not sent automatically (for example, because the team is not using a supported source control system). It overrides team members specified in the 'exclude' list.
report.mail.on.error. only=true false	Determines whether reports are sent to the manager only if a task is generated or a fatal exception occurs. Team member emails are not affected by this setting; individual emails are sent only to team members who are responsible for reported tasks.
	Default: false
report.mail.server= [server]	Specifies the mail server used to send reports.
report.mail.port=[port]	Specifies the mail server host's port number.
	Default: 25
report.mail.security= [SL STARTTLS NONE]	Specifies the desired security. Available settings are SSL, STARTTLS, NONE. SSL is not available in Visual Studio.
report.mail.subject=My New Subject	Specifies the subject line of the emails sent. The default subject line is \${tool_name} Report - \${config_name}. For example, if you want to change the subject line to "Report for Project A", you would use
	report.mail.subject=Report for Project A
	<pre>Default: \${tool_name} Report - \${config_name}</pre>
report.mail.time_delay=	Specifies a time delay between emailing reports (to avoid bulk email restrictions).
[server]	Default: 0
	I.

report.mail.unknown= [email_address OR user_name_of_the_same_d omain]	Specifies where to mail reports for errors assigned to "unknown".
report.mail.username= [username] report.mail. password=[password] report.mail.realm=	Specifies the settings for SMTP server authentication. The realm value is required only for those servers that authenticate using SASL realm.
[realm]	
report. metrics_details=true fa lse	Determines whether an XML report with metrics summary information (as well as individual class and method detail data where applicable) is produced. This report will be generated only when a metrics-enabled Test Configuration is run. Metrics details will be shown in HTML and PDF reports.
	Default: true
report.setup.	Determines whether reports include a section about setup problems.
problems=top bottom hid den	top - Adds a "Setup Problems" section to the top of the report. This is the default.
	hidden - Prevents a "Setup Problems" section from being added.
	bottom - Adds a "Setup Problems" section to the bottom of the report.
	Default: bottom
report.	Determines whether reports include suppressed messages.
suppressed_msgs=true fa	Default: false
report.	Determines whether reports include test parameter details.
test_params=true false	Default: false
report. ue_coverage_details_htm ls=[coverage_type]	Determines whether a test's HTML report links to another report that includes source code annotated with line-by-line coverage details.
is-[coverage_type]	The following values can be used for [coverage_type]:
	LC - for line coverage SC - for statement coverage BCC - for block coverage DC - for decision coverage SCC - for simple condition coverage MCDC - for MC/DC coverage
session.tag=[name]	Specifies a session tag used to label these results. This value is used for uploading summary results to Team Server.
	The tag is an identifier of the module checked during the analysis process. Reports for different modules should be marked with different tags.
	Default: \${config_name}
tasks.source.control. details=true false	This setting specifies if additional information from source control, such as revisions and comments, is included in the report.

Parasoft DTP Settings

Setting	Purpose
dtp.enabled=true false	Determines whether the current C/C++test installation is connected to DTP.
dtp.server=[server]	Specifies the host name of the DTP server.
dtp.port=[port]	Specifies the port number of the DTP server.
dtp.user=[username]	Specifies the username for DTP server authentication.
dtp.password=[password]	Specifies the password for DTP server authentication. We highly recommend that you use an encoded password to ensure successful authentication and increase the level of security; see Creating an Encoded Password.
report.dtp.publish=true fal	Enables or disables reporting results to DTP server.

dtp.project=[project_name]	Specifies the name of the DTP project that you want these results linked to.
<pre>dtp.additional.settings= [KEY1\=VALUE1\nKEY2\=VALUE2]</pre>	Specifies advanced settings for reporting results to DTP.
dtp.autoconfig=true false	Enables autoconfiguration with C/C++test settings stored on the DTP server

Team Server Settings

Setting	Purpose
tcm.server. enabled=true false	Determines whether C/C++test is connected to the Parasoft Team Server.
	Default: false
tcm.server.name=[name]	Specifies the machine name or IP address of the machine running Team Server.
tcm.server.port=[port]	Specifies the Team Server port number.
	Default: 18888
tcm.server. accountLogin=true false	Determines whether username and password are submitted to connect to Team Server. Usernames/passwords are not always needed; it depends on your team's setup.
tcm.server.username=	If the first setting is true, the second and third settings specify the username and password.
<pre>[username] tcm.server.password= [password]</pre>	Note that Team Server must have the username and password setting already enabled before these settings can be used.
	tcm.server.accountLogin default: false

Licensing Settings

See Manually Adding the License to local settlings for additional notes and examples.

Setting	Purpose
cpptest. license. use_network= true false	Enables or disables retrieving a network license. Example: cpptest.license.use_network=true Default: true By default, C/C++test will try to retrieve a license form License Server on the DTP configured as your primary DTP server; see Parasoft DTP Settings. If you want to configure another License Server, enable the license.network.use.specified.server option.
cpptest. license. local. password= [password]	Specifies the local password that you want C/C++test to use.
cpptest. license.loca l. expiration= [expiration]	Specifies the expiration date of the local license. Default: 0
cpptest. license.netw ork.edition= [edition_nam e]	Specifies the type of license that you want C/C++test to retrieve from License Server. [edition_name] can be automation_edition. To use a custom edition, do not set anything after the "="; simply leaving the value empty. Example: cpptest.license.network.edition=desktop_edition cpptest.license.network.edition=automation_edition
	Default: custom_edition

<pre>cpptest. license. custom_editi on_features= [feature name]</pre>	Specifies the features you want to enable in the custom edition of the C/C++test license.
<pre>cpptest. license. wait.for. tokens.time= [time in minutes]</pre>	Specifies the time that C/C++test will wait for a license if a license is not currently available. For example to make C++test wait 3 minutes for license tokens, use cpptest.wait.for.tokens.time=3. Default: 0
<pre>cpptest. license. autoconf. timeout= [seconds]</pre>	Specifies the maximum number of seconds C/C++test will wait for the license to be automatically configured from License Server. Default: 20
license. network.use. specified. server=true false	Enables or disables retrieving the license from a custom License Server specified with the license.network.host and license .network.port options. Example: license.network.use.specified.server=true Default: false
license. network. host=[host]	Specifies the host name of the standalone License Server, secondary DTP, or legacy License Server that you use to obtain the license. It requires the license.network.use.specified.server option set to true. Example: license.network.host=jade.mycompany.com If you retrieve the license from a standalone License Server that uses the HTTPS protocol, precede the hostname with https://
license. network. port=[port]	Specifies the port number that is assigned to License Server specified with the license.network.host option. For a standalone License Server: Depends on your Tomcat settings; typically, a HTTP port, for example, 8080. For License Server on secondary DTP: Typically, a HTTPS port, for example 443 or 8443. For legacy License Server: Typically, 2002. Example: license.network.port=2222
license. network. connection. type= [http tcp]	Specifies the connection type if you obtain your license from a custom License Server. http: Allows you to obtain the license from a standalone License Server or License Server on secondary DTP. tcp: Allows you to obtain the license from Legacy License Server. It requires the license.network.use.specified.server, license.network.host, and license.network.port to be enabled. Example: license.network.connection.type=http
license. network. auth. enabled=true false	Enables or disables authentication on the secondary DTP server specified with the license.network.host and license.network.port options. It requires the license.network.use.specified.server option to be set to true.
license. network. user= [username]	Specifies the username for authentication on the secondary DTP server specified with the license.network.host and license.network.port options. It requires the license.network.use.specified.server and license.network.auth.enabled options set to true. Example: license.network.user=JohnSnow
license. network. password= [password]	Specifies the password for authentication on the secondary DTP server specified with the license.network.host and license.network.port options. It requires the license.network.use.specified.server and license.network.auth. enabled options set to true, and the the license.network.user to be configured. We highly recommend that you use an encoded password to ensure successful authentication and increase the level of security; see Creating an Encoded Password. Example: license.network.password=Wic2019!

OpenID Connect Settings

Setting Purpose

oidc.enabled=true false	Enables or disables user authentication via OpenID Connect.
	The default is false.
oidc.issuer.uri= [uri]	Specifies the URI of the OpenID Connect server where your DTP is registered.
<pre>oidc.client.id= [id]</pre>	Specifies the ID registered on your OpenID Connect server.
oidc.client. secret=[password]	Specifies the password provided by your OpenID Connect server.
oidc.keystore=	Specifies the path to the keystore file that stores the certificate to authenticate the user on the OpenID Connect server.
[path]	They keystore file can only store one certificate. Parasoft testing tools do not support keystores with multiple certificates.
oidc.keystore. password= [password]	Specifies the password to the the keystore file that stores the self-signed client certificate. We highly recommend that you use an encoded password to ensure successful authentication and increase the level of security; see Creating an Encoded Password.
oidc.callback. host=localhost	This setting specifies the local callback host configured in the IDE to communicate with the OpenID Connect server.
127.0.0.1	1 This is an IDE-related setting and is not intended for command line use.
	The default is localhost.
oidc.callback.	This setting specifies the callback port number configured in the IDE to communicate with the OpenID Connect server.
port=0 [port number]	This is an IDE-related setting and is not intended for command line use.
	0: The port will be automatically configured.
	The default is 0.
oidc.callback. timeout=[seconds]	This setting specifies the maximum time allowed for providing user credentials on the authentication page to authenticate on DTP via OpenID Connect when working with C/C++test in the IDE.
	This is an IDE-related setting and is not intended for command line use.
	The default is 60.

Technical Support Settings

Setting	Purpose
techsupport. auto_creation=true fa	Determines whether archives are automatically prepared when testing problems occur.
lse	Default: false
techsupport. send_email=true false	Determines whether prepared archives are emailed to Parasoft support. If you enable this, be sure to specify email settings from the GUI or with the options in Reporting Settings.
	Default: false
techsupport. archive_location= [directory]	Specifies where archives are stored.
techsupport. verbose=true false	Determines whether verbose logs are included in the archive. Note that this option cannot be enabled if the logging system has custom configurations.
	 Verbose logs are stored in the xtest.log file within the user-home temporary location (on Windows, this is <driv e="">:\Documents and Settings\cuser>\Local Settings\Temp\parasoft\xtest).</driv> Verbose logging state is cross-session persistent (restored on application startup). The log file is a rolling file: it won't grow over a certain size, and each time it achieves the maximum size, a backup will be created.
	Default: false
techsupport.verbose. scontrol=true false	Determines whether verbose logs include output from source control commands. Note that the output could include fragments of your source code.
	Default: false

techsupport.item. general=true false	Determines whether general application logs are included. Default: false
techsupport.item. environment=true false	Determines whether environment variables, JVM system properties, platform details, additional properties (memory, other) are included in the archive. Default: false
techsupport. advanced=true false	Specifies if advanced options will be sent. Default: false
techsupport.advanced. options=[option]	Specifies any advanced options that the support team asked you to enter. Default: false
techsupport.dtp. engine=true false	Specifies if additional data generated during analysis will be sent. Default: false

Authorship/Scope Settings

Setting	Purpose
authors.mappings. location=team local shared	Specifies where the authorship mapping file is stored. This setting defaults to team unless local or shared is specified.
	If set to local (recommended), authorship mappings can be set directly in local settings. See authors.mapping and authors.user $\{n\}$ for details.
	If set to shared, you can store map-pings in a local file using the authors.mappings.file option.
	The team and shared options are deprecated. Files specified by these options should be in the previously-used format of:
	#author to author user1=user3 user2=user3
	#author to email
	user3=me@parasoft.com
	Default: team
<pre>authors.mapping{n}= [from user,</pre>	Specifies a specific author mapping for authors.mappings.location=local, as described above.
to_user]	For example:
	authors.mappings.location=local authors.mapping1=baduser,gooduser authors.mapping2=brokenuser,fixeduser authors.mapping3=olduser,newuser
authors.user{n}=	Specifies a specific author name and email for authors.mappings.location=local.
<pre>[username, email, full_name]</pre>	For example:
	authors.userl=dan,dan@parasoft.com,Dan Stowe authors.user2=jim,jim@parasoft.com,Jim White
authors.mappings.	Specifies the location of a "shared" file as described in authors.mappings.location above.
file=[path]	For example:
	authors.mappings.file=/home/user/dev/temp/author_mapping1.txt
authors.ignore. case=true false	Determines whether author names are case sensitive. If true, David and david will be considered the same user. If false, David and david will be considered two separate users.
	Default: false
scope. sourcecontrol=true	Determines whether C++test computes code authorship based on a data from a supported source control system. This setting is not needed if you want to use the value specified in the GUI.
false	Default: false

scope. local=true false	Determines whether C++test computes code authorship based on the local user. This setting is not needed if you want to use the value specified in the GUI. Default: true
scope.recommended. computation=first r	Determines how C/C++test selects the Recommended Tasks for each team member—it can choose n tasks at random (the default) or select the first n tasks reported (n is the maximum number of tasks that C/C++test is configured to show each team member per day)
scope. xmlmap=true false	Determines whether task assignment is computed based on XML files that define how you want tasks assigned for particular files or sets of files (these mappings can be specified in the GUI then saved in an XML file). Default: true
<pre>scope.xmlmap.file= [file]</pre>	Specifies the name of the XML file that defines how you want tasks assigned for particular files or sets of files.

Source Control Settings

Defining multiple repositories of the same type

Indexes (numbered from 1 to n) must be added to the prefix if you want to define more than one repository of the same type. For example:

scontrol.rep1.type=ccase
scontrol.rep1.ccase.vob=/vobs/myvob1
scontrol.rep2.type=ccase
scontrol.rep2.ccase.vob=/vobs/myvob2

If you are defining only one repository, you do not need to use an index. For example:

scontrol.rep.type=ccase
scontrol.rep.ccase.vob=/vobs/myvob1

AccuRev Repository Definition Properties

Property	Description
scontrol.rep.type=accurev	AccuRev repository type identifier.
scontrol.rep.accurev.host=	AccuRev server host.
scontrol.rep.accurev.port=	AccuRev server port. Default port is 1666.
scontrol.rep.accurev.login=	AccuRev user name.
scontrol.rep.accurev.password=	AccuRev password.

ClearCase Repository Definition Properties

Property	Description
scontrol.ccase.exec=	Path to external client executable (cleartool).
scontrol.rep.type=ccase	ClearCase repository type name.
scontrol.rep.ccase.vob=	Path inside VOB. ccase.vob value + File.separator must be the valid path to a ClearCase controlled directory.

CVS Repository Definition Properties

Property	Description
scontrol.rep. type=cvs	CVS repository type identifier.
scontrol.rep. cvs.root=	Full CVSROOT value.

scontrol.rep.	Plain or encoded password. The encoded password should be the same as in the .cvspass file.
cvs.pass=	For CVS use the value in .cvspass from within the user's home directory
	For CVSNT use the value store in the registry under HKEY_CURRENT_USER\Software\Cvsnt\cvspass
	When you are first logged in to the CVS repository from the command line using "cvs login", the password is saved in the registry. To retrieve it, go to the registry (using regedit), and look for the value under HKEY_CURRENT_USER->CVSNT> cvspass. This should display your entire login name (:pserver:exampleA@exampleB:/exampleC) encrypted password value.
scontrol.rep. cvs. useCustomSSHC reden-tials=	Determines whether the cvs login and password should be used for EXT/SSH connections. Allowed values are true and false. It is disabled by default.
scontrol.rep.	If connecting to a CVS server in EXT mode, this specifies which CVS application to start on the server side.
server	Has the same meaning as the CVS_SERVER variable .cvs is the default value.
scontrol.rep. cvs.ssh. loginname=	Specifies the login for SSH connections (if an external program can be used to provide the login).
scontrol.rep. cvs.ssh. password=	Specifies the password for SSH connection.
scontrol.rep. cvs.ssh. keyfile=	Specifies the private key file to establish an SSH connection with key authentication.
scontrol.rep. cvs.ssh. passphrase=	Specifies the passphrase for SSH connections with the key authentication mechanism.
scontrol.rep. cvs.useShell=	Enable an external program (CVS_RSH) to establish a connection to the CVS repository. Allowed values are true and false. It is disabled by default.
<pre>scontrol.rep. cvs.ext. shell=</pre>	Specifies the path to the executable to be used as the CVS_RSH program. Command line parameters should be specified in the cvs.ext.params property.
scontrol.rep. cvs.ext. params=	Specifies the parameters to be passed to an external program. The following case-sensitive macro definitions can be used to expand values into command line parameters: • {host} repository host • {port} port • {user} cvs user • {password} cvs password • {extuser} parameter cvs.ssh.loginname • {extpassword} parameter cvs.ssh.password • {keyfile} parameter cvs.ssh.keyfile • {passphrase} parameter cvs.ssh.passphrase

Git Repository Definition Properties

Property	Description
scontrol.rep.type=git	Git repository type identifier.
scontrol.git.exec=	Path to Git executable. If not set, assumes git command is on the path.
scontrol.rep.git. branch=	The name of the branch that the source control module will use. This can be left blank and the currently checked out branch will be used.
scontrol.rep.git.url=	The remote repository URL (e.g., git://hostname/repo.git).
scontrol.rep.git. workspace=	The directory containing the local git repository.

Perforce Repository Definition Properties

Property

scontrol.perforce. exec=	Path to external client executable (p4).
scontrol.rep. type=perforce	Perforce repository type identifier.
scontrol.rep. perforce.host=	Perforce server host.
scontrol.rep. perforce.port=	Perforce server port. Default port is 1666.
scontrol.rep. perforce.login=	Perforce user name.
scontrol.rep. perforce.password=	Password.
scontrol.rep. perforce.client=	The client workspace name, as specified in the P4CLIENT environment variable or its equivalents. The workspace's root dir should be configured for local path (so that files can be downloaded).

Serena Dimensions Repository Definition Properties

Property	Description
scontrol.rep. type=serena	Serena Dimensions repository type identifier.
scontrol.serena. dmroot=	Path to the Serena Dimensions executable (e.g., scontrol.serena.dmroot=C\:\\Program Files (x86) \\Serena\\Dimensions 2009 R2\\CM\\)
scontrol.rep. serena.login=	Login name.
scontrol.rep. serena.password=	Password.
scontrol.rep. serena.host=	Serena Dimensions server host name.
scontrol.rep. serena.dbname=	Name of the database for C/C++test
scontrol.rep. serena.dbconn=	Connection string for that database.
scontrol.rep. serena.locale=	The language used (e.g., scontrol.rep.serena.locale=en_US).
scontrol.rep. serena.mapping=	If the project has been downloaded/moved to a location other than default work area, use this option to specify a mapping between the project (or stream) with the Serena repository and the local project.
	If you are working in the default work area, you do not need to define mappings.

StarTeam Repository Definition Properties

Property	Description
scontrol.rep. type=starteam	StarTeam repository type identifier.
<pre>scontrol.rep. starteam. host=</pre>	StarTeam server host.
sscontrol. rep.starteam. port=	StarTeam server port. Default port is 49201.
scontrol.rep. starteam. login=	Login name.

scontrol.rep. starteam. password=	Password (not encoded).
scontrol.rep. starteam. path=	When working with large multi-project repositories, you can improve performance by specifying the project, view, or folder that you are currently working with. You can indicate either a simple Project name (all views will be scanned when searching for the repository path), a Project/View (only the given view will scanned) or Project/View/Folder (only the specified Star Team folder will be scanned). Examples: scontrol.rep.starteam.path=projl scontrol.rep.starteam.path=projl/viewl scontrol.rep.starteam.path=projl/viewl/folderA scontrol.rep.starteam.path=projl/viewl/folderA/folderB
scontrol.rep. starteam. workdir=	If the scontrol.rep.starteam.path setting specifies a StarTeam view or folder, you can use this field to indicate a new working directory for the selected view's root folder (if the path represents a view) or a new working directory for the selected folder (if the path represents a folder). Examples: scontrol.rep.starteam.workdir=c:\\storage\\dv scontrol.rep.starteam.workdir=/home/storage/dv

Subversion Repository Definition Properties

Property	Description
scontrol.rep.type=svn	Subversion repository type identifier.
scontrol.rep.svn.url=	Subversion URL specifies protocol, server name, port and starting repository path (e.g., svn://buildmachine.foobar.com/home/svn).
scontrol.rep.svn.login=	Login name.
scontrol.rep.svn. password =	Password (not encoded).
scontrol.svn.exec=	Path to external client executable (svn).

CM Synergy Repository Definition Properties

Property	Description
scontrol.rep. type=synergy	Synergy/CM repository type identifier.
scontrol.rep.synergy. host=	Computer on which synergy/cm engine runs. Local host is used when missing. For Web mode, the host must be a valid Synergy Web URL with protocol and port (e.g., http://synergy.server:8400).
scontrol.rep.synergy.dbpath=	Absolute synergy database path e.g \\host\\db\\name (backslash symbols \\' in UNC/Windows paths must be doubled).
scontrol.rep.synergy. projspec=	Synergy project spec which contains project name and its version e.g name-version.
scontrol.rep.synergy. login=	Synergy user name.
scontrol.rep.synergy. password=	Synergy password (not encoded).
scontrol.rep.synergy. port=	Synergy port.
scontrol.rep.synergy. remote_client=	(UNIX only) Specifies that you want to start ccm as a remote client. Default value is false. Optional. This is not used for Web mode.
scontrol.rep.synergy. local_dbpath=	Specifies the path name to which your data-base information is copied when you are running a remote client session. If null, then the default location will be used. <i>This is not used for Web mode.</i>
scontrol.synergy. exec=	Path to external client executable (ccm)

Microsoft Team Foundation Server Repository Definition Properties

Property	Description
scontrol.rep.type=tfs	TFS repository type identifier.
scontrol.rep.tfs.host=	Name of the machine running TFS.
scontrol.rep.tfs.port=	TFS server's port number (optional; when not specified, 8080 is used).
scontrol.rep.tfs.protocol=	The protocol used to connect to TFS server. Available values are HTTP and HTTPS.
scontrol.rep.tfs.url=	TFS repository URL (for example, http://localhost:8080/tfs).
scontrol.rep.tfs.login =	TFS user name.
scontrol.rep.tfs.password=	TFS password.

Microsoft Visual Source Safe Repository Definition Properties

Property	Description
scontrol.rep.type=vss	Visual SourceSafe repository type identifier.
scontrol.rep.vss. ssdir=	Path of repository database (backslash symbols '\' in UNC/Windows paths must be doubled).
scontrol.rep.vss. projpath=	VSS project path.
scontrol.rep.vss. login=	VSS login.
scontrol.rep.vss. password=	VSS password.
scontrol.vss.exec=	Path to external client executable (ss).
scontrol.vss.lookup=	Determines whether a full VSS database search is performed to find associations between local paths and repository paths. True or false.

Important Notes

- The repository(n).vss.ssdir property shouldco ntain a UNC value even if the repository database resides locally.
- · Be aware of VSS Naming Syntax, Conventions and Limitations. Any character can be used for names or labels, except the following:
 - Dollar sign (\$)
 - At sign (@)
 - Angle brackets (< >), brackets ([]), braces ({}), and parentheses (())
 - Colon (:) and semicolon (;)
 Equal sign (=)

 - Caret sign (^)
 - Exclamation point (!)Percent sign (%)

 - Question mark (?)
 - Comma (,)
 - Quotation mark (single or double) (' ")
- VSS 6.0 (build 8163), which is deployed with Visual Studio 6, does not work properly with projects whose names start with a dot (.) symbol. If such a project name is used, subprojects cannot be added.
- Do not use custom working directories for sub-projects (example: Project \$/SomeProject has the working directory C:\TEMP\VSS\SomeProject and its subproject \$/SomeProject/SomeSubProject has the working directory D:\SomeSubProject).

File Encoding Settings

ng	Purpose
----	---------

fileencoding.mode=default user auto	Defines how file encoding is calculated.
	default specifies that you want to use system properties.
	user indicates that you will explicitly specify the encoding name (using the setting below).
	auto enables automatic detection of encoding for the Far-East language specified with fileencoding.autolanguage.
	Default: default
fileencoding.user-	If fileencoding.mode is set to user, this specifies the encoding name
encoding= <name_of_encoding></name_of_encoding>	Valid names are ASCII-US, UTF-8, UTF-16, UTF-16LE, UTF-16BE or java.nio canonical name.
	It should be specified in form parasoft-dotNET-[codepagenumber]
fileencoding.auto-language= <language's numeric_code=""></language's>	If fileencoding.mode is set to auto, this specifies the language's numeric code. Valid codes are:
	 JAPANESE = 1 CHINESE = 2 SIMPLIFIED CHINESE = 3 TRADITIONAL CHINESE = 4 KOREAN = 5

Miscellaneous Settings

Setting	Purpose
report.rules= [url_path_to_	Specifies the directory for rules html files (generated by clicking the Printable Docs button in the Test Configuration's Static Analysis tab).
rules_directo ry]	For example:
	report.rules=file:///C:/Temp/Burt/parasoft/xtest/gendoc/report.rules=/gendoc/
	Default: none
tasks. clear=true fa	Clears existing tasks upon startup in cli mode. This prevents excessive time being spent "loading existing results."
lse	Default: true
console.	Specifies the verbosity level for the Console view. Available settings are:
verbosity. level=low nor mal high	low: Configures the Console view to show errors and basic information about the current step's name and status (done, failed, upto-date).
	normal: Also shows command lines and issues reported during test and analysis.
	high: Also shows warnings.
	Default: low
<pre>cpptest. custom.rules. dir= [directory]</pre>	Indicates where user-defined rules are saved.
<pre>cpptest. custom. configs.dir= [directory]</pre>	Indicates where user-defined Test Configurations are saved.
custom. compilers. dir= [directory]	Overrides the custom compiler directory settings (found in Parasoft> Configurations> Custom compilers) and uses the defined directory to search for custom compilers.
exec.env= [env1; env2;]	Specifies a list of tags that describe the environment where a test session was executed. Tags could describe an operating system (e.g. Windows, Linux), an architecture (e.g. x86, x86_64), a compiler, a browser, etc. These tags describe a complete test session; more environment details could be also added at the test suite, test, or test case levels via the services API.

issue. tracking. tags=[value]	Specifies custom issue tracking tags. Multiple tags can be separated by a comma. For example: issue.tracking.tags=@custom,@pr ,@fr	
	For more details, see Indicating Code and Test Correlations.	
parallel. mode=Manual A uto Disabled		
parallel. max_threads=< number>	Specifies the maximum number of parallel threads that can be executed simultaneously. The actual number of parallel threads is determined based on the number of CPUs, available memory, and license settings. Default: [available_processors]	
parallel. free_memory_l imit= <percent age></percent 	Specifies the amount of memory that should be kept free in low memory conditions (expressed as a percentage of the total memory available for the application). This is used to ensure that free memory is available for other processes. Default: 25	
parallel. no_memory_lim it=true false	Indicates that you do not want to place any restrictions (beyond existing system limitations) on the memory available to Parasoft Test.	
	Default: false	

Using Variables in Local Settings (Options) Files

The following variables can be used in report, e-mail, Parasoft DTP, Team Server, and license settings.

env var

example: \${env_var:HOME}

Outputs the value of the environmental variable specified after the colon.

1 The session tag value must not contain any ':' characters.

project_name

example: \${project_name}

Outputs the name of the tested project. If more than one project is provided as an input, it first outputs the tested project name, then "..."

workspace_name

example: \${workspace_name}

Outputs the Solution name.

config_name

\$ example: \${config_name}

Outputs the name of executed test configuration; applies only to report and email settings.

analysis_type

\$ example: \${analysis_type}

Outputs a comma separated list of enabled analysis types (for example: Static, Generation, Execution); applies only to reports and email settings.

tool_name

\$ example: \${tool_name}

Outputs the tool name (for example: C/C++test).

Examples

Example 1

```
# Report settings
report.developer_errors=true
report.developer_reports=true
report.format=html
session.tag=
report name>

# Mail settings:
report.mail.enabled=true
report.mail.cc=<managerl@mailserver.coml;manager2@mailserver.coml>
report.mail.server=mail.company.com
report.mail.domain=company.com
report.mail.subject=<Static Analysis results on Project X>
report.mail.attachments=true
```

Example 2

```
# Parasoft DTP settings
dtp.enabled==true
dtp.server=serverl.mycompany.com
dtp.port=32323
dtp.user=smith
dtp.password=?1q2W3e4R5t6Y7u8I9o!

# Mail settings
report.mail.enabled=true
report.mail.server=mail.mycompany.com
report.mail.domain=mycompany.com
report.mail.cc=project_manager
report.mail.subject=Coding Standards
```

Example 3

```
# REPORTS
#Determines whether reports are emailed to developers and to the additional recipients specified with the cc
#Remember that if the team is using CVS for source control and each developer's email address matches his or
her CVS username + the mail domain, each developer that worked on project code will automatically be sent a
report that contains only the errors/results related to his or her work.
report.mail.enabled=true
#Exclude developers emails (true/false)
report.mail.exclude.developers=false
# Append developers errors to manager emails (true/false)
report.developer_errors=true
# Send reports to developers (true false)
report.developer_reports=true
# Append suppressed messages (true false)
report.suppressed_msgs=false
#Determines where to mail complete test reports.
#This setting is typically used to send reports to managers or architects.
#It can also be used to send reports to developers if developer reports
#are not sent automatically (for example, because the team is not using CVS).
report.mail.cc=manager@domain.com; ${env_var:USERNAME} @domain.com
```

```
# mail target for unknown developer errors
report.mail.unknown=manager@domain.com
#Specifies the mail server used to send reports.
report.mail.server=mail_server.domain.com
#Specifies the mail domain used to send reports.
report.mail.domain=domain.com
#Specify mali from
report.mail.from=nightly
#Specifies any email addresses you do not want to receive reports.
#This setting is used to prevent from automatically sending reports to someone that worked on the code, but
should not be receiving reports. This setting is only applicable if the team is using CVS for source control
and developer reports are being sent automatically.
report.mail.exclude=developer1;developer2
# Specifies the subject line of the emails sent.
report.mail.subject= ${tool_name} Report - ${config_name}
# Report test params include (true|false)
report.test_params=true
# Team Server
#Determines whether the current installation is connected to the Team Server.
tcm.server.enabled=true
#Specifies the machine name or IP address of the machine running Team Server.
tcm.server.name=team_server.domain.com
#Specifies the Team Server port number.
tcm.server.port=18888
tcm.server.accountLogin=true
tcm.server.username=user
tcm.server.password=password
session.tag= ${config_name}
# SCOPE
#code authorship based on CVS
scope.sourcecontrol=true
#code authorship based on author tag
scope.author=false
#code authorship based on local user
scope.local=false
# LICENSE
#network license retrieved from DTP
dtp.enabled=true
dtp.server=onya.mycompany.com
dtp.port=443
dtp.user=user1
dtp.password=mypassword
cpptest.license.use_network=true
# SOURCE CONTROL
scontrol.repl.type=cvs
scontrol.repl.cvs.root=:pserver:developer@cvs_server.domain.com:/home/cvs/scontrol.repl.cvs.pass=mypassword
```
