

Running soatestcli from Ant or Maven

The Parasoft plugins for Maven and Ant allow you to integrate Parasoft SOAtest actions into your automated build process—facilitating continuous integration and testing. These plugins can invoke any test or analysis action that SOAtest or your other Parasoft product is licensed to perform (e.g., static analysis, unit testings, metrics analysis, functional testing, etc.). They can also execute the Parasoft Build Monitor, which analyzes your build and sends build warnings, errors, and the number of files successfully compiled to DTP.

For details, see <http://build.parasoft.com>.
