

Reviewing Results Overview

When the analysis is completed, the results can be reviewed:

- on the console - a result summary is printed to the output console.
- in an XML file - results are always saved in an XML file.
- in an HTML (default), PDF or a custom extension report; see [Customizing Reports](#) for information about specifying the report format.
- on DTP - if publishing results to DTP is enabled; see [Sending Results and Publishing Source Code to DTP](#).

By default, reports are saved within your working directory (the exact location depends on the build system you are using and is printed to the console at the end of the run), but you can configure a custom location, as well as specify what information will be included in the report; see [Customizing Reports](#).

File paths that are displayed in reports follow the resource pattern syntax; see [Configuring the Test Scope](#).
