

Creating Smart API Tests from Traffic

You can automatically create "smart" API tests from a recorded traffic file. Smart API tests are tests that are automatically configured using the same advanced Smart Test Generator technology used in the [Parasoft Recorder](#). An Advanced Test Generator license is required. See [Licensing](#) for Advanced Test Generator license options.

1. Add a new test suite and choose **Traffic > Generate Smart API Tests** in the creation wizard. See [Adding Projects, .tst files, and Test Suites](#) for details on using traffic wizards.
2. Specify the traffic file and choose the application type when prompted. The Application type field displays configuration files stored in the <WORKSPACE>/TestAssets/test_templates directory. See [Configuring Smart API Test Generation](#) for additional information about the configuration files for smart API test generation.

3. Review and adjust your tests to meet your current testing goals.
