

# Build Utilities

C/C++test supports the majority of C/C++ build systems available on the market, as well as custom build scripts for managing the build process.

Depending on your development environment, C/C++test may automatically integrate with your build system, or you may need to manually integrate C/C++test into your build process by modifying your build command with the `cpptestscan` or `cpptesttrace` tools shipped with C/C++test; see [Using cpptestscan or cpptesttrace](#) for details.
