

Literal Message Responder

This is one the most common types of Message Responder.

It allows quick and easy input of response messages in an editor with text and file inputs. Each Message Responder responds to incoming request messages that match its Responder Correlation criteria. Responses can be configured in a variety of modes, ranging from simple fixed messages to dynamic parameterized messages using a data source. Message Responders are protocol agnostic, but the transport protocol or API to access a responder is defined in the deployment configuration of the PVA.

You can create a Literal XML Message Responder tool directly from the Add Responder wizards. This responder is preconfigured as follows:

Setting	Configuration
Resource Mode	No Service Definition
XML Message Type	Plain XML
Response tab view	Literal

With Literal input mode, you can rapidly paste content into the Response tab to start configuring response messages.

All of the available configuration options for this type of message responder are covered in [Message Responder Overview](#).
