

# Parasoft License Server

License Server is a tool that enables you to manage licenses for Parasoft products deployed to your network. It can store and distribute license tokens to Parasoft tools that are configured to retrieve a license from License Server.

If you integrate with DTP, License Server is shipped with DTP and is automatically installed when DTP is deployed to your server. You can also install and launch License Server as a standalone web application.

This user guide contains information on how to install, configure, and use a standalone License Server. For details about License Server deployed to your DTP, see the Parasoft DTP User Guide.
