

# Virtualize Server Usage

Once deployed, Parasoft Virtualize Server can be used for core virtual asset management tasks as outlined in <http://localhost:8080/soavirt/api> (Swagger docs) and <http://localhost:8080/axis2/services/StubService?wsdl> (WSDL definition of the SOAP services).

You can add Virtualize Server as a remote server in the [Virtualize Server view](#). If you are using Parasoft CTP, Parasoft Virtualize Server can also be used for virtual asset deployment. If the required `env.manager.*` properties are set in the properties file (as described in [Configuring Virtualize Server](#)), the server will automatically register itself with Parasoft CTP.
